CHAPTER 1: Installation

Introduction

Overview

The iVAM1-1 is a 1RU multichannel multi-source audio/video monitor with basic 3G-SDI and analog inputs. It may also be purchased with a large variety of other inputs or these may be added later at the need arises. Refer to the Specifications section of this manual or contact Wohler Sales for more information.

The iVAM1-1 is compact and simple to operate, with straightforward controls. It has a touch screen LCD display providing either video or high resolution level meters, and in addition has an HDMI output. Any channels (or channel pairs) from any audio/video source stream may be monitored. Either 8 or 16 channel meters can be displayed.

The iVAM1-1 includes two 3G SDI inputs and it can monitor both video and audio from them. Optional modules will allow decoding of an additional SDI input, MADI, AES3, TOSLINK, SMPTE 2110, and SMPTE 2022-6 streams. It contains APIs for remote management.

The iVAM1-1 has options for VoIP formats including SMPTE 2022-6, SMPTE 2022-7, 3G/HD/SD-SDI, and a growing range of additional I/O options via SFP interfaces. Refer to the Specifications section of this manual or contact Wohler Sales for more information.

Setups are created and configured using local menus and a web browser over a network connection to the integral web server of the iVAM1-1. The web server will also allow you to view the audio meters remotely.

Safety

Instructions

1. Read, keep, and follow all of these instructions; heed all warnings.
2. Do not use this equipment near water.
3. Use only a dry cloth to clean the equipment.
4. Do not block any ventilation openings.
5. Do not install near any heat source such as a radiator, heat register, amplifier, or stove.
6. Do not attempt to plug the unit into a two-blade outlet (with only two prongs of equal width).

Important:

By design, the supplied AC mains power cord will only plug into a three-prong grounded outlet for your safety. If the plug does not fit into the outlet, contact an electrician to replace the obsolete outlet.

7. Protect the power cord from being walked on or pinched, particularly at plug connection on the equipment and at the socket.
8. Use only the attachments/accessories specified by the manufacturer.
9. Unplug the equipment during lightning storms or when unused for long periods of time.
10. Refer all servicing to qualified service personnel. Servicing will be required under all of the following conditions:
 - a. The equipment has been damaged in any way, such as when the power-supply cord or plug is damaged.
 - b. Liquid had been spilled or objects have fallen onto the equipment.
 - c. The equipment has been exposed to rain or moisture.
 - d. The equipment does not operate normally.
 - e. The equipment has been dropped.

Safety Symbols

WARNING:

The symbol to the left warns of electric shock hazard inside the unit. Disconnect the power cord before removing access panels when installing upgrades. Only qualified service personnel are to operate the equipment with covers removed, and are to exercise caution to avoid personal injury.

Mounting

The unit is designed for a standard 19" rack. Install it at ear/eye level for best high frequency response and visual observation of the display screens. Please adhere to the following clearances:

Table 1-1: Clearance Recommendations

Clearance	Surface
24"	Front
3"	Rear
2"	Sides
1.75"	Top and Bottom (if either radiates heat)
0"	Top and Bottom (if no heat)

Heat Dissipation

The ambient temperature inside the mounting enclosure should not exceed 40° Celsius (104° Fahrenheit). Adjacent devices can be rack mounted (or stacked) in proximity to the unit if this temperature is not exceeded. Otherwise, allow a 1RU (1.75"/44.45mm) space above and below the unit for air circulation.

Important

Heat generated by the class D power amplifiers, power supplies, and other components is vented by slots in the sides and back of the unit. Therefore, as a safety precaution, you must allow proper ventilation on these surfaces.

Sympathetic Vibration

Sympathetic vibration from other equipment (cables, etc.) in the rack may be serious enough to interfere with the unit's sound quality. If you experience sympathetic vibrations, use thin card stock, felt, foam, or weather-stripping between the vibrating surfaces. Tie loose cables securely with cable ties.

Mechanical Bracing

The 1RU chassis is securely attached to the front panel. In addition, the chassis has mounting tabs through which you attach it to the rack rail. This feature will reduce or eliminate rear bracing requirements in many mobile/portable applications. The weight of internal components is distributed fairly evenly around the unit.

Electrical Interference

Be careful to avoid mismatched cable types and other similar causes of undesired reflections in digital signal systems. If severe enough, such reflections can result in corruption of the digital data stream. As with any audio equipment, maximum immunity from electrical interference requires the use of shielded cable; however, satisfactory results can sometimes be obtained without it. The internal circuitry ground is connected to the chassis.

Power

The unit connects to an AC mains power source (100 to 240 VAC, 65W, 50/60Hz) using an IEC power cord.

When the mains plug or appliance coupler is used as the disconnect device, the disconnect device should remain operable.

Compliance

FCC

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at their own expense.

ICES-003

This Class A digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

CHAPTER 2: Local Operation

Operation

The iVAM1-1 can be operated easily and simply from controls on its front panel, as described in this chapter. It may be accessed remotely in two ways, via the Wohler Web GUI for administrative purposes or by third party equipment via Application Programming Interface (API) commands. The Wohler Web GUI is described in Chapter 4 of this manual. The API commands are described in Appendix E of this manual.

Startup

The iVAM1-1 will begin its startup process when it is connected to power. There is no power switch. It is normal for the product to require about 45 seconds to start up and be ready to use.

When the iVAM1-1 completes its startup, the **Status** indicator will turn green. Depending upon optional settings, all channel pairs will either be in the muted condition or set in a predetermined way. You may then use the **Source** and **Channel** controls to enable only the program channels you want to hear.

Front Panel

The front panel is shown in Figure 2-1.

Figure 2-1: iVAM1-1 Front Panel

1. **Level Meters & Video:** A 2.4" LCD screen allows monitoring of either video or high resolution bar graph meters of up to 16 channels. Press the **Source** control to switch between them.
2. **Speakers:** Local near field audio monitoring is achieved through the use of class D amplifiers. There are two (left/right) speakers. The speaker response may be adjusted with tone controls in the **Speaker Options** menu. Refer to the **Menu / Option Touchscreen** section of Chapter 2.
3. **Headphone Jack:** A 1/4" jack for an optional headphone is provided on the front

panel. Speaker audio can be optioned to either mute or not mute when headphones are plugged in. This is set in the **Speaker Options** menu. If the speaker audio is set to mute with headphone insertion, and a headphone is plugged into the Headphone Jack, the following icon will appear at the center top of the

display: 

4. **Volume:** This controls the speakers, the headphone, the analog outputs, and the HDMI audio output. As the **Volume** control is turned, a graphic appears on the upper left of the screen in place of the Source display, as follows: 

Pressing the **Volume** control mutes the audio and a speaker muted icon appears at the center top the display:  This icon also displays whenever the **Volume** control is turned all the way counterclockwise.

5. **Balance:** This controls the relative left/right levels for the monitored stereo mix. Pressing the knob will bring the balance back to center. It controls the speakers, the headphone, the analog outputs, and the HDMI audio output. As the **Balance** control is turned, a graphic appears in place of the Source display as follows:

6. **Source:** Turning this control right or left selects between the available licensed input sources. In 8 Channel Mode, the **Source** control also selects between the lower or upper 8 channels for 16-channel sources. Note that for 8-channel sources, the 8 channels are always displayed with 8 larger meters. The selected Source

input is displayed in the upper left of the meter screen as follows:

SDI-1

Pressing the **Source** control selects between displaying the video from the selected SDI source or displaying audio meters from the selected source. Holding the **Source** control pressed for two seconds proceeds to the **Main Menu**.

Alternatively, rotating the **Source** control can be set to No Operation, so that rotating it will have no effect at all. Refer to the **Source Knob Select** setting in the **Unit Config** menu.

7. **Channel:** Turning this control moves a white selection box from channel to channel on the metering screen. Press the control to solo the highlighted channel. The box will turn blue and any other boxes will disappear. To remove the solo and return to the previous monitoring configuration, press the **Channel** control once again.
8. **USB:** This USB 2.0 Type A connector allows you to use a flash drive (not supplied) to perform software updates. Refer to Appendix A of this manual to learn about performing a software update.
9. **Status:** This indicator lights green when the system is powered and ready for use. A solid or blinking yellow color indicates that the product is starting up. A red color indicates that a system update is taking place. Refer to Appendix A.

Rear Panel

The rear panel is shown in Figure 2-2.

Figure 2-2: iVAM1-1 Rear Panel and Option Cards

Power Connection: The iVAM1-1 receives power from an AC inlet, which is a standard IEC receptacle for 100 to 240 VAC $\pm 10\%$, 50/60 Hz power connection. Four regional AC power cords, supplied according to shipping region, are available.

Important:

By design, the supplied AC mains power cord will only plug into a three-prong grounded outlet for your safety. If the plug does not fit into the outlet, contact an electrician to replace the obsolete outlet.

1. **SDI Inputs:** These two BNC connectors accept the two 3G/HD/SD-SDI input signals containing audio and video to be monitored. This is a standard feature.
2. **SDI Output:** This BNC connector outputs the selected 3G/HD/SD-SDI or SFP module input signal.
3. **HDMI Output:** An HDMI output of the monitored 3G/HD/SD-SDI or SFP module video source is available from this connection.

4. **Network Port:** This Ethernet port can connect to either a LAN or to a PC to let you perform administrative tasks remotely. The Wohler Web GUI is described in Chapter 4 of this manual. Third party equipment, connecting to the iVAM1-1 via a LAN plugged into this port and using an API commands, can view and change product options, as well. This API is described in Appendix E of this manual.
5. **MADI BNC:** (optional) The COAX input accepts an AES10 64-channel signal at 48 kHz sample rate. An optional license key must be purchased to enable this function. The COAX output is reclocked from the MADI source. When power to the iVAM1-1 is not present, the COAX input and output are automatically connected together to allow the MADI signal to pass through. A software license must be installed for this input to function. Refer to the **System Setup** section in Chapter 4 and to Figure 4-22 to install software licenses.
6. **MADI Fiber SFP:** (optional) This input module accepts an optical AES10 64-channel MADI input signal at 48 kHz sample rate. An optional license key must be purchased to enable this function. A software license must be installed for SFP ports to function. Refer to the **System Setup** section in Chapter 4 and to Figure 4-22 to install software licenses.
7. **AES Inputs:** (optional) This HD-15F connector accepts 4 AES3id digital audio pairs (8 channels) at a 48 kHz sample rate. Refer to Figure 2-3 for the pinout of this connector. The easiest way to interface with this connector is to use an HD-15 to VGA adaptor cable. Channels are selected as AES 1-8. A software license must be installed for these inputs to function. Refer to the **System Setup** section in Chapter 4 and to Figure 4-22 to install software licenses.

Figure 2-3: AES HD-15F Connector Pinout

8. **AES Outputs:** This HD-15F connector provides 4 AES3id digital audio pairs (8 channels) at a 48 kHz sample rate from selected monitored sources. Refer to Figure 2-3 for the pinout of this connector. The easiest way to interface with this connector is to use an HD-15 to VGA adaptor cable. These outputs are not controlled by the **Volume** and **Balance** controls. Monitored channels 1 and 2 are sent from AES-1, channels 3 and 4 are sent from AES-2, channels 5 and 6 are sent from AES-3, and channels 7 and 8 are sent from AES-4.

9. **SFP Module Cage:** An SFP cage is provided to accept one optional SFP module compatible with SDI coaxial or optical signals. The SFP modules are hot swappable for convenience. An optional license key must be purchased to enable each module. A software license must be installed for the SFP port to function. Refer to the **System Setup** section in Chapter 4 and to Figure 4-22 to install software licenses. The following SFP modules are offered:
- a. **3G/HD/SD-SDI Single Video Receiver with Active Loopback:** This uses HD-BNC connectors.
 - b. **3G/HD/SD-SDI Video SFP with Optical Input:** This uses LC fiber connectors. It is a Single-Mode Receiver, Medium Haul, Non-MSA, and no output.
 - c. **SMPTE 2022-6 Receiver:** This uses Multi-Mode 850 NM, LC fiber connectors. It allows the iVAM1-1 to monitor SDI audio transmitted in real time over Ethernet. You must use the MN-Set configuration software to set up this option. It is available from Wohler Technologies Technical Service.
 - d. **SMPTE 2110 Receiver:** This uses Multi-Mode 850 NM, LC fiber connectors. It allows the iVAM1-1 to monitor SDI audio transmitted in real time over Ethernet. You must use the MN-Set configuration software to set up this option. It is available from Wohler Technologies Technical Service.
 - e. **SMPTE 2110 or 2022-6 Receiver:** This uses Multi-Mode 850 NM, LC fiber connectors. It allows the iVAM1-1 to monitor SDI audio transmitted in real time over Ethernet. You must use the MN-Set configuration software to set up this option. It is available from Wohler Technologies Technical Service.
10. **Analog Inputs:** These female XLR connectors provide two balanced analog inputs: Left and Right. The **Analog Inputs** are standard on the iVAM1-1. Refer to Figure 2-4 for the pinout of this connector.

Figure 2-4: Analog XLR-F Output Connections

11. **Analog XLR Outputs:** These male XLR connectors provide two balanced analog outputs: Left and Right. The source of these signals is the mix of

audio as monitored by the internal speakers and is adjusted by the **Volume** and **Balance** controls. The **Analog Outputs** are standard on the iVAM1-1. Refer to Figure 2-5 for the pinout of this connector.

Figure 2-5: Analog XLR-M Output Connections

12. **TOSLINK Optical Input** (optional): This connector is located on the panel of the optional OPT-iVAM ANALOG Option card, as well as on the panels of the optional 829171 or 829172 AoIP Option cards. It provides an optical stereo pair input.
13. **Unbalanced Stereo Analog Inputs** (optional): These 1/8" jacks are located on the panels of the optional 829171-1 or 829172-1 AoIP Option cards. They provide connections for left and right unbalanced stereo input channels.
14. **Balanced Analog DB-25 Outputs** (optional): This DB-25 female connector outputs 8 channels of +10dBu broadcast level balanced audio. This connector is located on the panel of the optional OPT-iVAM ANALOG Option card. The source of these signals is the monitored audio channels as shown on meters 1 - 8. Tascam cables may be used, and can be purchased by contacting Wohler Sales. Refer to Figure 2-6 for the pinout of this connector.

Note: PCM channels marked as data channels (such as those containing encoded Dolby streams) are automatically muted from being sent out to the external amplifier and speakers.

Note: When these outputs are used to connect to an external amplifier and speakers, the external amplifier should be muted whenever the iVAM1-1 is being powered up or powered down.

15. **Balanced Analog DB-25 Inputs** (optional): This DB-25 female connector inputs 8 channels of up to +10dBu broadcast level balanced audio. This connector is located on the panel of the optional OPT-iVAM ANALOG Option card. These signals are monitored on meters 1 - 8 by default. Tascam cables may be used, and can be purchased by contacting Wohler Sales. Refer to Figure 2-6 for the pinout of this connector.

Figure 2-6: Analog DB-25F Input and Output Connections

16. **AoIP SFP Module Cage** (optional): This provides a location in which to insert the AoIP Module supplied with the OPT-DANTE (iVAM) and OPT RAVENNA 64 options.
17. **Primary / Secondary 1GB ENET** (optional): Primary and Secondary Gigabit Ethernet interfaces are provided for use with for Dante64 or Ravenna64 / AES67 SMPTE 2022-7 processing options.
18. **Combo Port** (optional): An optional 1GB Fiber Ethernet SFP module and the Primary RJ-45 Ethernet port on the option card operate as a combo port, that is, they provide two different physical layers, optical fiber or electrical, but share the same Ethernet characteristics. However, the two different ports cannot be used simultaneously. You must choose to connect either one or the other.

SFP-2022-6 / SFP-2110 Address Setup

While the optional SFP-2022-6 and SFP-2110 modules monitor program audio created from distinctly different technologies, both are connected to the network in the same way and have the same requirements for addressing. Figure 2-7 illustrates the network connections they need.

Figure 2-7: SFP-2022-6 and SFP2110 Network Diagram

The optional SFP-2022-6 or SFP-2110 module furnished by Wohler Technologies is manufactured by Embrionix and comes from the factory with a default IP address. To integrate it into your digital network, you need to set its address to the source to be monitored. You must use the MN-Set configuration software to set up this option. It is available from Wohler Technologies Technical Service. The procedure to accomplish this is described in the **SFP-2022-6 / SFP-2110 Setup Guide** (part number 821822), which is available at <https://wohler.com/downloads/>.

Channel Meters and Touch Operations

The audio mixer terminology of “solo” is used in this manual when referring to muting all but a specific audio channel or pair.

Audio meters are displayed on touchscreen LCD display(s) in up to 8 channel pairs, as shown in Figure 2-8. Alternatively, 8-Channel Mode can be turned on to display only 4 channel pairs, as shown in Figure 2-9.

Figure 2-8: Audio Level Meter Screen

Figure 2-9: Audio Level Meter Screen, 8-Channel Mode On

1. **Channel Identifiers:** Above the level meters are the Channel Identifiers. They indicate the consecutive channel numbers in the selected source.
2. **Channel Pair Touch Selection Area:** Touching the meters of any channel pair will let you mute, un-mute, or solo the associated

channel(s). Colored boxes surrounding the channel pair or channel indicate what operation is being performed. Note that if it is not necessary to view all 16 channels at the same time, 8-Channel Mode can be turned on, resulting in 8 larger, easier-to-touch meters being displayed. The 8-Channel Mode setting is in the **Unit Config Menu**. The following describes each function:

- a. **Mute / Un-Mute Selection:** A violet box surrounds any channel pair that is muted. Typically, when the iVAM1-1 is first powered, all of the channel pairs are muted. Touching a muted channel pair unmutes it and removes the violet box. Muting and un-muting by touching is an alternate action function.
 - b. **Solo Selector:** Touch for two seconds any channel pair you would like to solo. A blue box will then surround the pair and that will be the only pair you hear. Any violet boxes will disappear. Touching another channel pair will then move the blue box to it, and it will be soloed. Touch again to return the combination of monitored channel pairs to the way they were before you soloed the pair.
 - c. **Channel Solo:** Rotating the **Channel** control will move a white selection box from channel to channel. Press the **Channel** control to solo the selected channel. That channel alone will then be surrounded by a blue box and it will become the only channel being monitored. Press the **Channel** control again or touch anywhere on the meters to undo the solo and return the combination of monitored channel pairs to as it was before you soloed the channel.
3. **Phase Indicators:** At the bottom of each channel pair is a Phase Indicator. The indicators light a dull green if the channels in the pair are in phase or bright red if they are out of phase. You may set which Phase Indicators appear using the **Phase Config Menu** or with the **System Preferences: Phase Indicator Configuration** tab in the Wohler Web GUI.

Video Screen

Pressing the **Source** knob alternates between the Video Screen and the Meter Screen on an SDI source. Information about the signal can be superimposed over the upper part of the video image. The **Video Info** selection in the **Unit Config Menu** determines whether this information is always displayed, never displayed, or is only displayed for the first 5 or 10 seconds after switching to the video screen. Figure 2-10 shows the Video Screen.

Figure 2-10: Video Screen

1. **Video Source:** This translucent box displays the input source of the video signal.
2. **Video Signal:** This translucent box displays the resolution and frame rate of the video signal.

Note: If the **Video Source** and **Video Signal** displays have been optioned to disappear after 5 or 10 seconds and you wish them to reappear, simply touch the video screen.

Menu / Option Touchscreen

You may set most options or view a variety of system information using the self-contained menus. To access this, touch the **Menu** button which appears on the right of the level meter screen. Figure 2-11 is a diagram of the menu arrangement, a tree showing how to reach any menu from the **Main Menu**. Figure 2-12 shows the **Main Menu**.

Figure 2-11: Menu Tree

Main Menu

Touching the **Menu** button on the **Audio Meters** screen will access the **Main Menu**. Alternatively, especially when monitoring the video program, you may access the **Main Menu** by holding the **Source** knob pressed for two seconds. The **Main Menu** is shown in Figure 2-12.

Figure 2-12: Main Menu

Audio Meters

Touching the **Audio Meters** selection on the **Main Menu** screen simply returns you to the Audio Level Meters screen.

Source Select

Touching the **Source Select** selection on the **Main Menu** proceeds to the **Source Select** menu. While the monitored source can simply be selected by rotating the **Source** knob on the front panel, this menu is provided to show all of the possible sources. The selected source is shown in a light color. You may simply touch another source in this menu to switch to it. This screen also shows sources which are unlicensed and therefore nonfunctional. These sources are shown in a gray color. To license these sources so that they may be used, contact Wohler Technologies. Figure 2-13 shows the Source Select Menu.

Figure 2-13: Source Select Menu

Touch **Menu** to exit this menu.

If you touch MADI BNC, MADI Optical, or SFP, an additional selection screen will be shown, asking you select which 16 MADI channels to monitor or which SFP functionality to monitor. If a feature is not installed, a message will appear describing what you should do. These screens are shown in Figure 2-14.

Note: AoIP, TosLink and/or Analog (DB25) sources are only available if the appropriate hardware option cards are installed on the unit. Refer to Table 3-3. If not installed, then the system will show message **Feature is not supported or requires valid hardware**, as illustrated in the last screen shown in Figure 2-14.

Figure 2-14: MADI, SFP, Analog, & AoIP Selection Screens:

Touch **Back** to return to the **Source Select** menu or touch **Menu** to return to the **Main Menu**.

Preset Favorites

Touch the **Preset Favorites** button to display the Preset Favorites screen. This is a purchased and licensed feature. It shows the Presets that you have designated as Favorites. Refer to the Dashboard section of Chapter 4. Generally, these are frequently used Presets that you want to separate out from the possibly many other Presets in the system. The Preset Favorites screen is shown in Figure 2-15.

Figure 2-15: Preset Favorites Screen

In this screen, the currently selected Preset is shown in bright yellow. Touch any Preset to select it. To exit this screen without making a selection, touch **Menu**. If no Favorite Presets have been designated, this screen will appear as shown in Figure 2-16.

Figure 2-16: Preset Favorites Screen - No Favorites

All Presets

Touch the **All Presets** button to display the All Presets Group Selection screen as shown in Figure 2-17. This is a purchased and licensed feature. If no Presets have been created, the screen in Figure 2-19 appears instead.

Figure 2-17: All Presets Screen - Group Selection

The Presets are normally arranged into Groups. Use this screen to select which Preset-containing Group to examine. After selecting one of the Groups, the Preset Selection screen shown in Figure 2-18 is shown.

Figure 2-18: All Presets Screen - Preset Selection

To select a Preset, touch the associated button. After a quick 2-second delay, the metering screen will display the channels contained in that source.

To return to the All Presets Group Selection screen instead, touch the **Groups** button. To return to the Menu without making a selection, touch the **Menu** button.

Figure 2-19: All Presets Screen - No Presets

To return to the Menu from this screen, touch the **Menu** button.

Unit Settings

Touching the **Unit Settings** selection on the **Main Menu** screen proceeds to the **Unit Settings Menu**, which contains additional menu selections. The **Unit Settings Menu** is shown in Figure 2-20. This is an intermediary menu which leads to other menus and screens.

Figure 2-20: Unit Settings Menu

Speaker Options

Touching the **Speaker Options** selection on the **Unit Settings** Menu screen proceeds to the **Speaker Options** screen. The controls on this screen affect various characteristics of the monitored audio as heard on the iVAM1-1. This screen is shown in Figure 2-21.

Figure 2-21: Speaker Options Screen

The controls function as follows:

1. **Treble**: This tone control adjusts the high frequency speaker audio response from -12 dB to +12 dB. Lowering **Treble** compensates for high frequency pre-emphasis or removes sibilance effects. Increasing **Treble** will add "sizzle" to the sound and bring high-pitched sounds out of the mix. The control can be touched and moved left or right to adjust in 2 dB increments. After touching the **Treble** control, the **Channel** knob can also be turned to make the adjustment.
2. **Bass**: This tone control adjusts the low frequency speaker audio response from -12 dB to +12 dB. Lowering **Bass** will unmask midrange band sounds, while increasing **Bass** will make the sound "fatter". The control can be touched and moved left or right to adjust in 2 dB increments. After touching the **Bass** control, the **Channel** knob can also be turned to make the adjustment.
3. **Set to Flat**: This setting returns the **Treble** and **Bass** control settings to 0 dB, producing a flat frequency response.

Touch **Back** to exit this screen.

Meter Scales

Touching the **Meter Scales** button on the **Unit Settings** Menu displays the **Meter Scales** screen as shown in Figure 2-22. The controls on this screen select the scale standards as well as the ballistics that will be applied to the audio meters.

Figure 2-22: Meter Scales Screen

The controls function as follows:

1. **Scale:** This meter scales standard to be used when displaying audio levels. A choice of seven scales is available. Touch the left or right arrows to select the scale. A representation of the chosen scale will be shown at the right. The possible scales that can be selected are shown in Figure 2-23.

Figure 2-23: Meter Scale Selection

Table 2-4: Meter Limits and References

Scale	Bottom Limit	Top Limit	Default Reference	Default Color Bounds		Default Ballistics	
				Lower	Upper	Float	Bar
AES	-72 dBFS	0.0 dBFS	0 dBFS = 0 dBFS	-30 dBFS	-20 dBFS	IEC Type I	VU
DIN	-53 dBr	+5.5 dBr	-15 dBFS = 0 dBr	-5 dBr	0 dBr	—	IEC Type I
BBC	-13.25 dBr	+13.0 dBr	-18 dBFS = 0 dBr	0 dBr	8 dBr	—	IEC Type I
VU	-45 dBr	+3.5 dBr	-20 dBFS = 0 dBr	-3 dBr	0 dBr	—	VU
EXTVU	-56 dBr	+16.0 dBr	-20 dBFS = 0 dBr	-10 dBr	0 dBr	—	VU
NORDIC	-44 dBr	+12.5 dBr	-18 dBFS = 0 dBr	-10 dBr	0 dBr	—	IEC Type I
EBU	-13.25 dBr	+13.0 dBr	-18 dBFS = 0 dBr	0 dBr	8 dBr	—	IEC Type I

2. **Ballistics:** The Bar and Float ballistics associated with the selected meter scale are displayed. Refer to Table 2-5. Ballistic timings are valid only at 48 kHz.

Table 2-5: Meter Timings

Ballistics	Rise	Fall	
		Level Change	Time
VU	Not Specified		
IEC Type I	5 ms to reach -2 dB of settled reading	-20 dB	1.7 sec.
IEC Type II	10 ms to reach -2 dB of settled reading	-24 dB	2.8 sec.
None	Bar or Floating Segment Not Displayed		

When you have made your choices, touch **Save** to retain them. Touch **Back** or **Meters** to exit this screen.

Unit Configuration

Touching the **Unit Config** selection on the **Unit Settings** Menu proceeds to the **Unit Config Menu**. This menu is shown in Figure 2-24.

Figure 2-24: Unit Configuration Menu

The controls function as follows:

1. **Brightness:** This setting adjusts the brightness of the display screen. Touch the left pointing arrow to dim the brightness or touch the right pointing arrow to increase the brightness.
2. **Video Info:** This setting determines if or how video information is displayed when the video screen is selected by pressing the **Source** knob. The possible selections are as follows:
 - a. **Always On:** The video information is always displayed.
 - b. **Off:** The video information is never displayed.
 - c. **5 Secs:** The video information is displayed for 5 seconds after the video screen is selected and then it disappears.
 - d. **10 Secs:** The video information is displayed for 10 seconds after the video screen is selected and then it disappears.
3. **AES termination:** AES signals should have one and only one termination. This termination should physically be at the last destination of an AES coax cable. If the iVAM1-1 is the last connection in a series of AES connections, then its terminations should be turned on. A symptom of too many terminations (or no termination) is that no signal appears to be present on the AES input. Touch the On - Off switch to change the termination setting.
4. **Source Knob Selection:** This setting determines the function of the **Source** knob on the front panel. It may be set as follows, depending upon your needs:
 - a. **Source Select:** The **Source** knob will select the input source to be monitored.
 - b. **No Operation:** Rotating the **Source** knob will do nothing. If the **Source** knob is set to **No Operation** and is turned, the Audio Meters

screen will display **No Operation** for 3 seconds at the top left, as a reminder.

Touch **Back** to exit this menu.

Phase Configuration

Touching the **Phase Config** selection on the **Unit Settings** Menu proceeds to the **Phase Config Menu**. This menu is shown in Figure 2-25.

Figure 2-25: Phase Configuration Menu

The controls function as follows:

1. **Pair 1 - 8:** These switches allow you to select which channel pairs will receive a phase meter on the **Metering Screen**. Generally, it is useful to monitor the relative phase of stereo pairs. However, sometimes each channel of a pair is unrelated to each other. This can be because the channels are used to convey two independent monophonic signals or that one channel may be a Center channel and the other may be a Low Frequency Effects channel. In these instances, the Phase Indicator would almost always indicate an out of phase condition. Because this would be a needless distraction to the operator, switches are provided on this screen to individually turn phase monitoring for each channel pair on or off.
2. **Cancel & Exit:** If you decide that you do not want to keep the settings you have made on this screen, touch the **Cancel & Exit** button to discard the changes and return to the **Unit Settings** menu.
3. **Save & Exit:** When you have finished making the changes you want on this screen, touch the **Save & Exit** button to save the changes and return to the **Unit Settings** menu.

HDMI Settings

Touching the **HDMI Settings** selection on the **Main Menu** proceeds to the **HDMI Settings** menu, as shown in Figure 2-26.

Figure 2-26: HDMI Settings Menu

The controls in this menu function as follows:

1. **HDMI Display:** Set to **On** or **Off** to enable or disable the HDMI Output on the rear panel. The HDMI Output will allow you to view the monitored video on an external HDMI monitor.
2. **Use EDID:** HDMI monitors can produce Extended Display Identification Data (EDID) to disclose their capabilities to the video source. The iVAM1-1 can use this information to ensure its compatibility with the HDMI Monitor. If you decide that you do not want the iVAM1-1 to receive this information, set this switch to **Off**. By default this switch is set to **On**.
3. **Pixel Format:** This selection can only be adjusted if the **Use EDID** setting is set to **Off**. The possible choices are:
 - a. RGB
 - b. YCbCr444
 - c. YCbCr422
4. **Save & Exit:** When you have finished making the changes you want on this screen, touch the **Save & Exit** button to save the changes and return to the **Unit Settings** menu.

To exit this menu without saving, touch the **Back** button.

Meter Mode

Touching the **Meter Mode** selection on the **Unit Settings** Menu proceeds to the **Meter Mode Menu**. This menu is shown in Figure 2-27.

Figure 2-27: Meter Mode Menu

The control functions as follows:

1. **8 Channel Mode:** This setting selects whether 16 meters are shown on the Metering Screen or whether 8 larger meters are displayed instead. If it is not necessary to view 16 meters at a time, 8 larger, easier-to-touch meters can be a better choice. Touch the On - Off switch to change the 8 Channel Mode setting.

To exit this menu and save your selection, touch **Save & Exit**. To exit this menu without saving your selection, touch **Cancel & Exit**.

System Options Menu

Touching System Options in the **Main Menu** proceeds to the **System Options** menu, which is an intermediate menu leading to other screens. This menu is shown in Figure 2-28.

Figure 2-28: System Options Menu

Touch **Menu** to exit this menu.

Network Settings

Touch the **Network Settings** selection on the **System Options** Menu displays the **Network Settings** menu as shown in Figure 2-29. This screen lets you view or change the product IP, the Net Mask, Gateway and DNS. It also lets you switch between a static (fixed) or a dynamic (DHCP) network address.

Figure 2-29: Network Settings Screen

1. To change the IP Address, Net Mask, Gateway, or DNS, tap the item you would like to change. A keypad will appear, as shown in Figure 2-30.

Figure 2-30: Network Configuration: Setting Change

2. Touch the digits to be entered and then touch the **Enter** button. The **Clear** button may be touched to erase any mistyped digits.
3. Now repeat steps 1 and 2 until you have replaced all of the necessary digits.
4. To save the newly entered address, touch the **Enter** button. Touch the **Cancel** button to return to the previous screen without saving any changes.

Important:

There is no confirmation for **Save**, so make sure you want to perform this action before taking it. The system does not need to reboot before it is once again ready for operation.

To change from a static (fixed) to a dynamic (DHCP) network address, touch the **DHCP** button. The screen will change, as shown in Figure 2-31. To change back to a static (fixed) network address, touch the **DHCP** button again. The colors of the buttons will return to the ones depicted in Figure 2-29.

Figure 2-31: Network Settings: DHCP

Use DHCP	
Address	192.168.0.151
Mask	255.255.255.0
Gateway	192.168.0.1
DNS	192.168.0.1

1. To complete the network addressing scheme change, touch the **Save** button. This will save the changes you selected.
2. Touch the **Cancel** button to return to the previous screen without saving any changes.

Important:

There is no confirmation for **Save and Exit**, so make sure you want to perform this action before taking it. The system will not need to reboot before it is once again ready for operation.

System Reboot

Touching the **System Reboot** selection on the **System Options** Menu displays the **System Reboot** screen as shown in Figure 2-32. This function is normally only used upon request from Wohler Technical Service to troubleshoot or correct an issue.

The **System Reboot** function should be used with a bit of forethought. It puts the system out of service for several minutes while it is rebooting.

Figure 2-32: System Reboot

If you have any doubt as to whether you should press **Yes**, press **Back** or **No** instead, and contact Wohler Technical Service for advice. Pressing **Back** or **No** will return you to the **System Options** menu.

System Update

Touching the **System Update** selection in the **System Options** Menu displays **System Update** screen as shown in Figure 2-33, showing the current software version of the product. To update the system software locally from the iVAM1-1 front panel, follow the procedure in the **Local Update from the Front Panel** section of Appendix A.

Figure 2-33: System Update Screen

If you have just inserted a flash drive with a valid software upgrade package, press **Refresh** to see that package.

Touch the **Back** button return to the **System Options Menu**.

Factory Reset

Touching the **Factory Reset** selection in the **System Options** menu displays the **Factory Reset** screen as shown in Figure 2-34. Because of the large change this function is about to make to the product, it asks for you for verification that you really want to proceed.

The **Factory Reset** function should be used with caution. It deletes all of the settings you have programmed into the system. It returns the system to the way it was when received new from the factory. After using this function, you will need to use the Wohler Web GUI to reprogram everything from the start.

Figure 2-34: Factory Reset

Note: **Factory Reset** will also reset your IP address to the default one. After a Factory Reset, the IP Settings will need to be updated. The default IP address for the unit is determined based upon the Mac address. It is 169.254.1.xx where xx is the last octet of the management Mac address. For example, if the Mac address is b4:ed:54:d0:04:28 then the IP address would be 169.254.1.40 (40 is the decimal equivalent for the last octet of Mac address 28.)

If you have any doubt as to whether you should press **Yes**, press **Back** or **No** instead, and contact Wohler Technical Service for advice. Pressing **Back** or **No** will return you to the **System Options** menu.

System Information

Touching the **System Details** selection in the **System Options** menu displays the **System Details** screen as shown in Figure 2-35. This screen lets you view the product Serial Number, Software Version, and various other information.

Figure 2-35: System Details Screen

<i>System Details</i>		Menu
System State / Mode	Valid / Normal	
System IP Address	192.168.0.222	
Software Version	0.0.15	
Serial Number	#####	
MAC Address	B4:ed:54:d0:07:20	
Option Card	Not Present	

The information shown on this screen is read only and cannot be changed.
Touch **Back** to return to the **System Options** Menu.

CHAPTER 3: Technical Info

Table 3-1: iVAM1-1 Specifications

Specification	Values/Domains
Power Requirements	100 VAC to 240 VAC $\pm$ 10%, 50/60Hz
Power Consumption	65 Watts
Dimensions (H x W x D)	1.75" x 19" x 5.5" (44mm x 483mm x 140mm), standard 19" rack mounting
Shipping/Net Weight	8 lbs. (3.6 kg) / 5.5 lbs. (2.5kg)
Supplied Accessories	AC Power Cord
Display Type	2.4" Capacitive Touchscreen LCD
Screen Resolution	320H x 240V
Viewing Angle	160 (H) x 160 (V)
Audio Channels	16 Max
Level Meters	Simultaneous Average & PPM
Level Meter Scale	Choice of AES, BBC, DIN, EBU, EXTVU, NORDIC, or VU
Sample Rate	48kHz
De-Multiplexing	16 channels from: • 16-channel SD/HD/3G-SDI • 64-channel AES10 MADI
SDI Inputs / Outputs	• 1 or 2 SDI Inputs or Outputs Optional – Single SFP Transceiver: • HD-BNC Coax 3G/HD/SD-SDI • Multi-Mode Fiber: 1 SI Optical SC-Connector, 1300nm • Single-Mode Fiber: 1 SI Optical SC Connector, 1310nm
MADI Inputs / Outputs	• 1 MADI BNC, Standard Coax I/O Optional – SFP Transceiver: • Multi-Mode Fiber: 1 MADI Optical SC-Connector, 1300nm • Single-Mode Fiber: 1 MADI Optical SC Connector, 1310nm
SMPTE 2022-6 Receiver	Optional - SFP Receiver: • Multi-Mode Fiber: LC Connectors, 850nm
SMPTE 2110 Receiver	Optional - SFP Receiver: • Multi-Mode Fiber: LC Connectors, 850nm

Specification	Values/Domains
Cable/Fiber Length (max)	COAX (such as Belden 1694A): > 150 m
	Single-mode fiber: 10 km
AES Inputs	8 AES channels on 2 x HD-15 are optional
Upgrades	Via USB interface
SDI Input Termination	75 Ω unbalanced
AES/EBU Input Termination	75 Ω unbalanced
AES/EBU/MADI Sampling Rate	48 kHz
Analog Inputs - Stereo	XLR-3 Female, balanced
Analog Input Impedance	40k Ω balanced
Analog Outputs - Stereo	XLR-3 Male, balanced +28 dBu max
Analog I/O – Multi-channel	8 Balanced Input Channels and 8 Balanced Output Channels on 2 x DB25F (Optional)
Analog Output Frequency Response	40 Hz to 20 kHz ($\pm$ 1dB)
Analog Output Distortion	<0.02% THD+N
Analog Output Dynamic Range	> 100 dB
Analog Output Reference Level	-20 dBFS = +4 $\pm$ 1.0 dBu
Internal Speakers - Stereo	70mm Full Range
Peak Acoustic Output	90 dB SPL (@ 2 feet)
Hum and Noise	Better than -68 dB below full output
Power Output	5 Watts RMS, 12 Watts peak (each side)
Acoustic Frequency Response	150 Hz to 16 kHz ($\pm$ 5 dB)
Headphone Out - Stereo	40 Hz to 20 kHz ($\pm$ 1 dB)
Headphone Load	8 Ω to 150 Ω

Table 3-2: iVAM1-1 I/O Options

Option	Part #	Description
SFP-Madi-MM-Fiber	829081	MADI optical fiber transceiver. Multi-Mode, LC (fiber) connectors. SFP module with software activation key.
SFP-Madi-SM-Fiber	829082	MADI optical fiber transceiver. Single-Mode, LC (fiber) connectors. SFP module with software activation key.
SFP-SDI	829089	3G/HD/SD-SDI single video receiver with active loopback, HD-BNC connectors. SFP module with software activation key.
SFP-SDI-Fiber	829084	3G/HD/SD-SDI video SFP optical input; LC (fiber) connectors; Single-Mode Receiver, Medium Haul, Non-MSA, no output.
SFP-2022-6	829088	SMTPE 2022-6 receiver; Multi-Mode 850 NM, LC (fiber) connectors. SFP module with software activation key. Use MN-Set** to configure SFP.
SFP-2110	829086	SMTPE 2110 receiver; Multi-Mode 850 NM, LC (fiber) connectors. SFP module with software activation key. Use MN-Set** to configure SFP.
SFP-2110+2022-6	829087	SMTPE 2110 or 2022-6 receiver; Multi-Mode 850 NM, LC (fiber) connectors. SFP module with software activation key. Use MN-Set** to configure SFP.
OPT-AES	829080	Enables decoding and monitoring of 4 x AES inputs on an HD-15 connector and 1 AES output on BNC connector. Requires a software activation key.
OPT-MADI	829092	Enables decoding and monitoring of 1 x MADI64 input. BNC connectors. Requires a software activation key.

**MN-Set is configuration software that is necessary so that you can set up this module. It is available at no cost either from its manufacturer, Embrionix, or by contacting Wohler Technologies Technical Service.

Table 3–3: iVAM1-1 Option Cards

Option	Part #	Description
OPT-ANLG/TOS (iVAM)	829170	Enable monitoring of 8 Analog channels on DB-25. TOSLINK included.
OPT-DANTE (iVAM)	829171	Enable decoding and monitoring of Dante™ input streams. Includes AoIP card. Enables 2 x RJ-45 ports for 2022-7 support (for Dante, Ravenna and 2110-30) + SFP cage allowing MM and SM SFP's for AoIP Signals. TOSLINK included.
OPT-DANTE (iVAM)	829171-1	Enable decoding and monitoring of Dante™ input streams. Includes AoIP card. Enables 2 x RJ-45 ports for 2022-7 support (for Dante, Ravenna and 2110-30) + SFP cage allowing MM and SM SFP's for AoIP Signals. Left and right unbalanced analog input jacks included.
OPT-RAVENNA 64 (iVAM)	829172	Enable monitoring of up to 64 Ravenna™ / AES67 input. NMOS support. Includes AoIP card. Enables 2 x RJ-45 ports for 2022-7 support (for Dante, Ravenna and 2110-30) + SFP cage allowing MM and SM SFP's for AoIP Signals. TOSLINK included.
OPT-RAVENNA 64 (iVAM)	829172-1	Enable monitoring of up to 64 Ravenna™ / AES67 input. NMOS support. Left and right unbalanced analog input jacks included.
OPT-SFP	829179	Adds two additional 3G inputs to 3G products, or two 12G inputs to 12G products.

Figure 3–1: iVAM1-1 Block Diagram

CHAPTER 4: The iVAM1-1 Web GUI

The self-contained iVAM1-1 Web GUI allows you to customize the configuration of the iVAM1-1 to suit your needs. If the default configuration of the iVAM1-1 suits your needs and you prefer to use it that way, then you do not need to use the iVAM1-1 Web GUI.

The iVAM1-1 Web GUI also allows you to have a remote view of the Meter Screen. Refer to the Audio Meters section in this chapter.

Web Browser / Control Device

Any web browser application running on any networked device such as desktop or laptop computer, tablet or smart phone can be used with the iVAM1-1 Web GUI.

Tablets with no network connector need to be linked to a copper LAN through a Wi-Fi adapter.

Although they can be used, smart phones are not recommended because their smaller screen size would require more scrolling, making operation challenging.

The Chrome[®] web browser is recommended for speed and compatibility.

First Time IP Assignments

The iVAM1-1 can operate with a static (fixed) or dynamic (DHCP) IPv4 address. The default address will be **169.254.1.x** where x depends upon the MAC address of the unit, when received from the factory or when switched from DHCP to static addressing mode. There two basic types of connections that may be used to connect the iVAM1-1 to a web browser, a **Peer-to-Peer Connection** or a **Network Connection**.

Peer-to-Peer Connection

The most straightforward way to connect the iVAM1-1 to a web browser, free of possible network conflicts, is to establish a static peer-to-peer connection between the setup computer and the iVAM1-1. A 10/100/1000 MHz Ethernet switch may be used in between, but is not required.

Figure 4-1 shows an example of suitable address settings for the host computer in a Windows control panel. For Peer-to-Peer the ip address of windows should be in 169.254.1.x domain.

Figure 4–1: Host IP Settings

Close the control panel and reboot the host computer after making an IP address change to be sure the change takes effect. **Either reconnect to the installed network or continue with this direct connection to access the iVAM1-1 Web GUI.**

Network Connection

When connected to a network, the iVAM1-1 address will need to be changed to another address in order to be compatible with the address assignments for that particular network. Immediately after the host setup is complete, change the iVAM1-1's address. Make the corresponding address, mask and gateway changes in the iVAM1-1 **Network Setup** page. Refer to the **Network Setup** section which follows.

Otherwise set the iVAM1-1 to DHCP address mode by checking the box for 'Use DHCP?' in Network Setup and have your IT administrator assign rights and settings for operation on the network. Allow enough time for your network's DHCP server to recognize a new network device and assign an address after booting.

The iVAM1-1 uses link local addressing for its internal network, so no accommodation for this need be made in the network.

Network Setup

Make network **IP Address** changes for the local iVAM1-1 **Management (MGMT) Port** here.

Figure 4–2: Set IP Addresses

The screenshot shows the 'Set Mgmt IP Address' configuration page in the iVAM1-1 web interface. The left sidebar contains navigation links: System Setup, Configuration (selected), Mgmt IP Address, System Preferences, System, Factory Reset, and Reboot System. The main content area is titled 'Set Mgmt IP Address' and includes a breadcrumb 'Home / Mgmt IP Address'. Below the title is a configuration section with the following fields: 'Use DHCP?' (checked), 'IP Address' (192.168.0.151), 'IP Mask' (255.255.255.0), 'Gateway Address' (192.168.0.1), and 'Dns' (192.168.0.1). At the bottom of the configuration section are 'Apply' and 'Reset' buttons. The footer of the page reads 'Copyright © Wohler Technologies, Inc. All rights reserved.'

The procedure for changing the IP Address information is as follows:

1. **Use DHCP?** Check this box if your network has a DHCP server and you want to use dynamic addressing. Otherwise, you must enter static IP address entries in the four fields which follow.
2. **IP Address:** Enter the network address. Leading zeroes are not required.
3. **IP Mask:** This should usually be 255.255.255.0 unless your network can work across multiple subnets.
4. **Gateway Address:** This should usually be the same domain and subnet address numbers as the IP Address, but with the last octet being .1.
5. **DNS-nameserver:** A default value is shown for reference only. DNS is not normally required for basic static IP network configurations to work. Your IT administrator will specify a value to work with mixed static/dynamic network setups.
6. **Apply:** When you have made all of the necessary entries, press **Apply** to apply the changes.
7. **Reset:** If you should start to make changes and then change your mind about making them, press **Reset** to return the settings back to where they were.

Dashboard

Throughout the Web GUI, pages are a click or two away using the list of selections on the left side. The **Dashboard** page shows all of the available Preset configurations at a glance. The iVAM1-1 allows you to assign Presets to particular groups. In Figure 4-3, one group is shown.

Figure 4-3: Dashboard Preset Overview

To view all of the Presets within any group, click on that group.

In Figure 4-4, it can be seen that there are three Presets in the G-1 group. The currently selected active Preset for local operation is shown in red. In Figure 4-4, there is no active Preset.

Figure 4-4: Dashboard Preset Recall / Edit

A Group / Preset Summary is shown in the upper right of the screen. This enables you to see the total number of Groups, Presets and Favorite Presets in the iVAM1-1.

Use the  button, as shown in Figure 4-4, to toggle between Favorite Presets or All Presets.

Click the **Recall** button to recall a Preset. To Edit a Preset, click the **Edit** icon, as shown in Figure 4-4, to the right of the associated **Recall** button.

The Edit options for a Preset are:

1. Delete: Remove the Preset from the system. **Do Not delete the currently active Preset.**
2. Rename: Rename the Preset, but keep all of its other characteristics.
3. Make Favorite: Make this Preset a favorite. This can be done for frequently used Presets.

Clicking a **Group Edit** button will cause the screen in Figure 4-5 to appear.

Figure 4-5: Dashboard Group Edit

The Edit options for a Group are as follows:

1. Delete: Delete the Group and all of the Presets it contains.
2. Rename: Rename the Group, but keep all of its other characteristics.

Audio Meters

Click on **Audio Meters** to remotely display the audio meters of the iVAM1-1. This display is shown in Figure 4-6. Also displayed is the name of the source that the meters are displaying. In Figure 4-6, this is SDI-1.

Figure 4-6: Audio Meters Display

System Preferences

Click on **System Preferences** to find the System Audio Clock Reference and Phase Indicator Configuration tabs. These are as shown in Figures 4-7 and 4-8.

System Audio Clock Reference

The System Audio Clock Reference setting provides a way to set the global clock source for the unit. This setting will be used whenever a source is selected using the **Source Select** knob or the **Source Select Menu**. If the System Audio Clock Reference is set to **None**, then the currently selected source acts as the Clock Reference. This tab is shown in Figure 4-7.

This System Audio Clock Reference setting can be overridden by the optional System Clock Reference setting in the Preset Management menu when the Preset is chosen.

Figure 4-7: System Audio Clock Reference Tab

Phase Indicator Configuration Tab

The Phase Indicator Configuration tab is as shown in Figure 4-8. It allows you to select which channel pairs will receive a phase meter on the **Metering Screen**. Generally, it is useful to monitor the relative phase of stereo pairs. However, sometimes each channel of a pair is unrelated to each other. This can be because the channels are used to convey two independent monophonic signals or that one channel may be a Center channel and the other may be a Low Frequency Effects channel. In these instances, the Phase Indicator would almost always indicate an out of phase condition. Because this would be a needless distraction to the operator, switches are provided on this tab to individually turn phase monitoring for each channel pair on or off. **Select All** and **Reset All** buttons are also provided.

Figure 4–8: Phase Indicator Configuration Tab

When you have finished making the settings click **Apply** to save them or click **Cancel** to discard them.

Preset Management

Preset Management is a feature that can be licensed on the iVAM1-1. Figure 4-9 shows the screen that appears when Preset Management is selected and the feature is not licensed. Refer to the **System Setup** section in Chapter 4 and to Figure 4-22 to install software licenses.

Figure 4-9: Unlicensed Preset Management Screen

Presets are monitoring configurations that can be composed of channels from multiple sources and displayed on the meters in any order. Presets should be set up to allow operators to quickly shift between setups for monitoring. The **Preset Management** screen contains selections of all of the details for a Preset, and is largely arranged in a matrix format connecting input channels to monitoring channels. The screen is shown in Figure 4-10.

Figure 4–10: Configure Presets

1. **Preset Configuration:** You may create a new Preset, adjust an existing Preset, or create a new Preset from an existing Preset:

- **To create a new Preset,** enter the name for the new Preset in the field to the left of the word **Preset**. Then make all of the settings needed and save it.
- **To make changes to an existing Preset,** select it from the pull down list, make the needed changes and save it.
- **To create a new Preset starting with an existing Preset,** first select the existing Preset from the pull down list. Next, enter the name for the new Preset and save it. Then make the needed changes and save it.

Presets may be created for any licensed inputs, even if the SFP module for an input is not plugged into its respective socket at the time. This makes it easy to swap SFP input modules without having to recreate presets after the insertion or removal of an SFP module. Note that if a licensed SFP module is not detected, such as when one is removed to be swapped, its monitoring inputs will be muted. Likewise, if the required license has not been entered for an SFP module that is inserted, its monitoring inputs will also be muted. Refer to the **Licenses** section in this chapter to install software licenses.

2. **System Clock Reference:** There must be a system clock reference for monitoring to take place. Select a reference from the pull down list. The best choice is a stable, always present clock source locked to house sync. Second

to that, use the selected input as the clock. Generally speaking, **Internal** is not the best choice.

3. **Speaker Delay:** If desired, an audio delay may be inserted ahead of the monitor speakers. This delay may range from 0 to 170 mS. Typically, delay is used to align the monitored audio with a video monitored signal.
4. **Input Selection:** Audio from any of the input sources may be applied to the monitoring scheme in any way. For example, you may have 6 channels from an SDI stream, along with 2 AES channels, and along with 2 analog channels assigned your choice of meters. A **Preset Input/Output Matrix** is provided on the lower right side of the screen to allow you to assign each channel. Simply select each input source, one at a time, and then check the boxes in the **Matrix** to apply each input channel number to a metered channel number. They do not have to be applied in any specific order. The order of assignment should be chosen to make it easy for the operator to understand. If there are more than 16 channels in a source, the desired group of 16 can also be selected from the box in the lower left of the screen.
5. **Autofill Selection:** If you simply want to map all 16 input channels to all 16 meters in the same order, click the **Autofill** button. The **Preset Input/Output Matrix** will automatically fill out. To remove all mapping, click the **Reset** button that is adjacent to the **Autofill** button.
6. **Cluster Definition and Naming:** Channel Clusters are a series of channels that are all associated with monitoring the same signal. For example, a Stereo Cluster consists of two channels that together monitor a stereo signal. A Surround 5.1 Cluster consists of 6 channels that together monitor a 5.1 surround sound signal. Clicking a **Cluster Info** box opens a **Cluster** selection box.

In the **Cluster** box, you can select the type of Cluster from a pull down selection. The available **Cluster Type** selections are:

- Mono 1.0: The channel will appear within a single-channel cluster.
- Stereo 2.0: The channels will appear within a two-channel cluster.
- Surround 5.1: The channels will appear within a 6-channel cluster.
- Surround 7.1: The channels will appear within an 8-channel cluster.
- Custom: You may define a 0 to 8 channel cluster.

Multichannel clusters will expand to the right and overwrite any clusters on overlapping meter positions.

By default, all odd numbered channels will map to the left speakers and all even numbered channels will map to the right speakers. You may change this using the crosspoint selections in the Input/Output Matrix.

A default name will be chosen and it will appear on the metering screen. You may name the Cluster anything you want by simply changing the words within the **Cluster Name** field.

When finished, click **Update**. To undo your change, click **Reset**. To undo all of the Cluster changes for the 16 channels, click **Reset All**.

7. **Speaker Assign:** Speaker assignments are made automatically when a cluster is set. However, it can be that in an actual signal, the channel assignments may be different than what the automatic assignment assumes.

A speaker assignment adjustment is provided for each channel, should you need to override the automatic settings. **It is important to accurately assign the function of each channel so that the Loudness calculations will be accurate.** Clicking a **Speaker Assign** button on a channel opens a box that lets you change the current setting.

8. **Mute/Unmute:** A **Mute/Unmute** control is provided for each channel, although the adjustment will affect all channels in the Cluster. This allows the operator to just see the meters for certain channels and not hear the audio. This is an alternate action control.
9. The **Global Phase Indicators** tab is as shown in Figure 4-11. It allows you to select which channel pairs will receive a phase meter on the **Metering Screen** in this Preset. Generally, it is useful to monitor the relative phase of stereo pairs. However, sometimes each channel of a pair is unrelated to each other. This can be because the channels are used to convey two independent monophonic signals or that one channel may be a Center channel and the other may be a Low Frequency Effects channel. In these instances, the Phase Indicator would almost always indicate an out of phase condition. Because this would be a needless distraction to the operator, switches are provided on this tab to individually turn phase monitoring for each channel pair on or off. By default, the settings for a Preset are the same as the system-wide configuration set on the System Preference tab. However, to make unique settings for this Preset, uncheck **Apply Global Phase Indicator Settings** and then simply click each switch to the desired on or off position. **Select All** and **Reset All** buttons are also provided.

Figure 4-11: Global Phase Indicator Enable / Disable

10. The **Output Routing** tab is shown in Figure 4-12 when the OPT-OUTPUT-ROUTING capability was not purchased and licensed. This tab shows how signals from the inputs are routed to the outputs. It allows you to view, but not change this default routing.

Figure 4-12: Default Output Routing

Default Output Routing

Default Output Routing

Global Output Routing (This feature requires a license)

Home / Configuration / Global Output Routing

Cluster Info.	Stereo 2.0	Stereo 2.1	Stereo 2.2	Stereo 2.3	Stereo 2.4	Stereo 2.5	Input Gain (dB)	Meter #

Note: Wohler offers a license upgrade to edit these choices on a global basis or on a preset by preset basis: OPT-OUTPUT-ROUTING (Item ID 829159). Please call +1-510-870-0810 or email sales@wohler.com to inquire further.

APPLY RESET RESET TO DEFAULT

However, if the OPT-OUTPUT-ROUTING license is installed, this tab allows you to determine exactly which input channels are routed to which outputs. It then appears as shown in Figure 4-13. This very flexible capability allows you to route signals according to Preset or as a default for the whole system. Refer to the **Global Output Routing** section in this chapter to learn the function of each of the checkboxes and of the matrix in this tab.

To set up a different input to output routing scheme for the Preset you are creating, click the **Global Output Routing** tab and uncheck the **Apply Global Output Routing** checkbox. You may then adjust the output routing as you desire on this tab and it will only apply to this Preset.

Figure 4-13: Output Routing Preset Tab

Global Output Routing Tab

11. When you have finished creating a Preset or making changes to a Preset, either click the **Save** button to save the Preset, click the **Save & Apply** button to save the Preset and make it the current Preset, or click the **Reset** button to discard the changes just made.

Output Routing

The **Output Routing** licensed feature (OPT-OUTPUT-ROUTING) allows channels to be routed or combined and routed in custom ways to various destination outputs. **Output Routing** is applied to:

1. Signals monitored using "Input Source select" from the Front Panel,
2. Presets that have been created to apply the Output Routing.

Any change to the routing will affect the Presets that have "Apply Output Routing" selected. For example, multiple channels of a 7.1 channel program can be combined and directed to the left or right internal speakers. Six or eight channels could be directed to the AES outputs, which could feed an external surround sound system. Contact Wohler Sales to purchase the license for the OPT-OUTPUT-ROUTING feature.

If **Output Routing** is not licensed, then any of the inputs can be monitored in stereo or mono only through the internal speakers. The headphone jack, the analog XLR outputs, and the first AES output will follow whatever is directed to the speakers.

When licensed, select **Global Output Routing** under **Configuration**. This will display the **Global Output Routing** screen. This screen contains a matrix of checkboxes which are an easy way for you to set up the wide variety of input to output routing and mixing capabilities. The **Global Output Routing** screen is shown in Figure 4-14.

APPLY RESET RESET TO DEFAULT

Destination Outputs

On the left of the **Global Output Routing** screen are listed the Destination Outputs. These are the outputs to which any input can be routed. They are as follows:

1. **Speaker/Headphone:** Selected inputs will be sent to the left and right speakers. The default routing is set as per the Speaker Assignment, left channels are sent to the left speaker and right channels are sent to Right speaker.
2. **Analog XLR:** Selected inputs will be mixed to the left and right channels and played through the two Analog XLR Outputs.
3. **AES/Pair-1:** Selected inputs will be mixed to the left and right channels and played through the AES Pair 1 Output.
4. **AES/Pair-2:** Selected inputs will be mixed to the left and right channels and played through the AES Pair 2 Output.
5. **AES/Pair-3:** Selected inputs will be mixed to the left and right channels and played through the AES Pair 3 Output.
6. **AES/Pair-4:** Selected inputs will be mixed to the left and right channels and played through the AES Pair 4 Output. The four AES outputs can be used together to output, for example, 5.1 or 7.1 surround channels to an external surround sound monitor system.
7. **AoIP/Pair-9 (DANTE / RAVENNA):** Selected inputs will be mixed to AoIP transmit channels 59 and 60. Note that configuration for channels 1 - 58 is not supported. Use a Dante Controller or Covelloz web interface to route these channels appropriately.
8. **AoIP/Pair-10 (DANTE / RAVENNA):** Selected inputs will be mixed to Channel 61 and Channel 62. Again, use a Dante Controller or Covelloz web interface to route the remaining pairs appropriately.
9. **HDMI/Pair-1:** Selected inputs will be mixed to the left and right channels and played through first pair of the HDMI Output.
10. **HDMI/Pair-2:** Selected inputs will be mixed to the left and right channels and played through second pair of the HDMI Output.
11. **HDMI/Pair-3:** Selected inputs will be mixed to the left and right channels and played through third pair of the HDMI Output.
12. **HDMI/Pair-4:** Selected inputs will be mixed to the left and right channels and played through fourth pair of the HDMI Output.

Source Inputs

The source inputs which may be routed are described in this section.

1. **Cluster Information:** Cluster information show type of cluster and cluster name.
2. **Speaker Assignment:** Speaker assignment can be used to configure to which speakers the audio is routed to. The possible options are:
 - L Left
 - R Right

- C** Center
- LFE** Low Frequency Effects
- Ls** Left Surround
- Rs** Right Surround
- Bsl** Back Surround Left
- Bsr** Back Surround Right
- S** Mono Surround

3. **Input/Output Matrix:** By checking the various boxes in this matrix, any input channels can be freely routed to any output channels. This flexible channel assignment is called a **Free Mix**. However, when the **Speaker Mix** box is checked in the **Output Options** section, the associated row within the matrix is automatically set to the speaker mix and the checkboxes are grayed out indicating that you may not change them with a **Free Mix** assignment.

Output Options

The optional settings in this section allow for customization.

1. **Speaker Mix:** This option selects whether an output has the **Speaker Mix** or a **Free Mix** as set in the Routing Input section. The Speaker/Headphone output is always in the **Speaker Mix**.
2. **Solo/Mute:** This setting determines whether or not the outputs are affected by solos and mutes. The Speaker/Headphone output is always affected by solos and mutes. Note also, that all outputs in **Speaker Mix** mode also are affected by solos and mutes.
3. **Mute on Headphone Insertion:** This option controls whether the outputs should be muted upon a headphone insertion. This setting can be adjusted even for outputs whether they are in **Speaker Mix** or **Free Mix** modes.
4. **Volume Control:** This setting determines whether each output pair is adjusted by the **Volume Control** knob. Speaker/Headphone outputs are always affected by the volume control knob, as are any outputs that are in **Speaker Mix** mode.

Typical Questions Regarding Output Routing

The questions and thoughts in this section are commonly asked by people when setting up the licensed Output Routing capability.

What signal outputs can be controlled using the Output Routing feature?

All the outputs on the iVAM1-1 can be controlled using the Output Routing feature. This includes – Internal Speakers, Analog XLR outputs, all 4 pairs of AES outputs on HD-15, AoIP Pair 9 and Pair 10 and all 4 pairs of HDMI outputs.

How do the outputs behave if I do not purchase OPT-OUTPUT-ROUTING license?

If Output routing license is not purchased, the outputs are configured as follows:

1. **Speakers:** All monitored channels are always available on the internal speakers. The left and right speaker assignment is determined by the **Speaker Assignment**. Audio on the speakers is controlled by the **Volume** and **Balance** knobs and is muted whenever a headphone is inserted into the **Headphone** jack.
2. **Analog XLRs:** These outputs follow the same configuration as the internal speakers. They are controlled by the **Volume** and **Balance** knobs and are muted whenever a headphone is inserted into the **Headphone** jack. These outputs also follow the solo/mute selections on the Audio Meter screen.
3. **AES Pairs 1 through 4:** The first 8 channels appear on these outputs in numeric order. They are pre-fade, so they are unaffected by the **Volume** and **Balance** knobs or headphone insertion. They are also unaffected by the solo/mute selections on the Audio Meter screen.
4. **AoIP Pairs 9 and 10:** These outputs follow the same configuration as the internal speakers. They are controlled by the **Volume** and **Balance** knobs and are muted whenever a headphone is inserted into the **Headphone** jack. These outputs also follow the solo/mute selections on the Audio Meter screen.
5. **HDMI Pair 1:** These outputs follow the same configuration as the internal speakers. They are controlled by the **Volume** and **Balance** knobs and are muted whenever a headphone is inserted into the **Headphone** jack. These outputs also follow the solo/mute selections on the Audio Meter screen.
6. **HDMI Pairs 2, 3 and 4:** These are not enabled in this case.

What is the difference between Global Output Routing and Output Routing in Presets?

Both are used to configure the unit outputs. Global Output Routing is applied by default when you select a source or when creating presets and when you don't change the Output Routing unique to any Preset. Changes to either of these are disabled if the OPT-OUTPUT-ROUTING license is not purchased.

How do I route whatever is being monitored to the XLR and AES outputs?

Using **Global Output Routing** (optional licensing upgrade), you may route any signals to the XLR & AES outputs. You may route signals to the XLR outputs using the **Analog/XLR** checkboxes and route signals to the AES outputs by using the **AES/Pair 1** to **Pair 4** checkboxes.

Analog / XLR	L 1	☐	☐	☐	☐	☐	☐	☒	☒	☒	☒	☐	☒	☐	☒	☒	☒	☐
	R 2	☐	☐	☐	☐	☐	☐	☐	☒	☒	☒	☒	☐	☒	☐	☐	☐	☐
AES/ Pair-1	L 1	☒	☒	☐	☒	☒	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
	R 2	☒	☒	☒	☒	☒	☒	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐

choices. This feature requires the optional OPT-OUTPUT-ROUTING output routing license.

How do I route only specific monitored channels to the Analog XLR outputs?

When the optional OPT-OUTPUT-ROUTING license is purchased, you may route specific channels as shown below. Here Audio Meter channels 9, 11, 13, and 15 are routed to the left analog XLR output and Audio Meter channels 10, 12, 14, and 16 are routed to the right analog XLR output. Unchecked channels are not routed. Make sure the **Speaker Mix** selection is turned off to enable this selection.

The optional Global Output Routing feature works great. But what if we don't want to create any Presets and want to monitor audio only using Source Select? How would I configure different outputs for Source Select choices?

Use the **Global Output Routing** settings to determine how the outputs are configured for source select options.

The **Global Output Routing** feature allows channels to be routed or combined and routed to various destinations. For example, channels 1 to 8 can be routed to AES outputs, while channels 9 to 16 can be routed to Analog XLR outputs:

How do I keep the internal speakers muted and have audio only on the analog XLR outputs?

When the optional OPT-OUTPUT-ROUTING license is purchased, in the **Global Output Routing** configuration, do not select any **Speaker Headphone** checkboxes for any meter channels as shown below, and then select the desired

meters for Analog XLR. In this way, the internal speakers will always be muted, but the audio will appear on the Analog XLR outputs (for amplified external speakers). Make sure that the **Speaker Mix** checkbox selection is unchecked for Analog/XLR.

																		Volume Control	Mute on Headphone Insertion	Solo Mute	Speaker Mix
Cluster info.		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0							
Speaker assign.		L	R	L	R	L	R	L	R	L	R	L	R	L	R						
Meter #		1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16				
Speaker Headphone	L 1	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☒	☒		
	R 2	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☒	☒		
Analog / XLR	L 1	☒	☐	☒	☐	☒	☐	☒	☐	☒	☐	☒	☐	☒	☐	☒	☐	☒	☒		
	R 2	☐	☒	☐	☒	☐	☒	☐	☒	☐	☒	☐	☒	☐	☒	☐	☒	☒	☐		

How do I ensure that the outputs are automatically muted when the Headphone jack is inserted?

When the optional OPT-OUTPUT-ROUTING license is purchased, in the **Global Output Routing** configuration, if the **Mute on Headphone Insertion** checkbox is ON then the outputs get automatically muted when a headphone is inserted into the Headphone jack.

As shown below, if a headphone is inserted then the output on the Analog XLRs will be muted, while the audio on AES Pair 1 will remain on.

Mute on Headphone Insertion:

On: Outputs are muted when Headphone Jack is inserted

Off: Outputs are not muted when Headphone Jack is inserted.

	Cluster info.	Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Volume Control	Mute on Headphone Insertion	Solo Mute	Speaker Mix
Speaker assign.	L	R	L	R	L	R	L	R	L	R	L	R	L	R	L	R					
Meter #		1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16				
Speaker Headphone	L 1	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☒	☒	☒	☒
	R 2	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☒	☒	☒	☒
Analog / XLR	L 1	☒	☐	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☐	☒	☐	☐
	R 2	☐	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☐	☒	☐	☐
AES/ Pair-1	L 1	☒	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
	R 2	☐	☒	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐

What are AoIP-Pair 9 and AoIP Pair 10?

AoIP-Pair 9: Selected inputs will be mixed to AoIP transmit channels 17 and 18. Note that configuration for channels 1 - 16 is not supported. Use a Dante Controller or Zman web interface to route these channels appropriately.

AoIP-Pair 10: Selected inputs will be mixed to Channel 19 and Channel 20. Again, use a Dante Controller or Zman web interface to route the remaining pairs appropriately.

How do I ensure that my outputs are pre-faded but follow the solo-mutes on the web interface? This will allow us to monitor only the unmuted/solo Audio Meter channels on amplified stereo speakers connected to the Analog XLR's.

In the **Output Routing** setting, for the Analog XLR outputs, keep the **Volume Control** checkbox unchecked and the **Solo/Mute** checkbox checked. This ensures that the Volume Control is **not** applied to the outputs, while the Solos/Mutes **are**.

Cluster info.		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Stereo 2.0		Volume Control	Headphone Insertion	Solo Mute	Speaker Mix

Preset Replication

Preset Replication allows you to copy presets from a master unit to multiple iVAM1-1 units. This can save a lot of setup time if multiple units all need basically the same setup.

To start Preset Replication, click on the **Preset Replication** tab on the master unit. This will start the unit discovery process and will list all the iVAM1-1 units that you currently have on your network. The discovery process will continue for a period of 2 minutes. However, you may stop the discovery process sooner if you believe all the units in the network have been discovered. Simply click the **Stop Scan** button.

Figure 4-15: Preset Replication Scanning Screen

#	Name	Serial	Model	System Version	IP Address	Preset Tag
1	iVAM1-1	162150	WOHLER_IVAM_919476	1.3.0	192.168.0.136	2

Once all the units are discovered you may either copy the presets that are currently created on the Master unit or can use an external preset file that you want to copy to any or all of the Target units. **Note that any and all of the Presets that may already be contained in each Target unit will be erased by copying the new Presets.**

Figure 4-16: Preset Replication Target Selection Screen

Click either **From Master Unit** or **Select Preset File**. This determines the source of the Presets to be copied. Preset Files would be files that you have previously stored in the computer running the Web GUI.

You may add a descriptive name or version to the Presets being copied. This may aid in remembering what tag or version of the presets are available on the unit. The Preset name or version may be up to 10 characters in length.

Next, select the Target units from the list of units shown by checking or unchecking each of the **Target** boxes at the left. Alternatively, you may click **Select All** to select all of the units. Then select the **Replicate Presets to Selected Devices** button. The progress of the Preset replication for each unit, as the Presets are being copied, will be displayed in the **Process** column. When all of the Presets have been copied to each of the selected units, you may leave this screen.

Import/Export Presets

Use the **Import / Export Presets** page to manage the Preset database in the iVAM1-1. You may export the Preset database onto the computer hard drive for security backup purposes or as a means to transfer it to another iVAM1-1. Likewise, it can be used to import a Preset database from the computer hard drive into the iVAM1-1. In this way, a Preset configuration may be only devised once and then duplicated into all of the iVAM1-1 units in a system, saving significant effort.

The iVAM1-1 will create Preset Tags for the each set of Presets. Refer to Figure 4-17. You may also change these Preset Tags, using the Preset Change Field. They allow you to quickly resolve questions about which Presets on various units are the most up to date. They will also allow you to determine whether Presets have been modified. If the Preset Tag displayed contains the suffix "-dirty" then at least one Preset has been changed in some way.

While exporting the file, the Preset Tag is appended to the filename, this allows you to store multiple Preset files with different file name. For example, if the Preset Tag is v1.0.0 then for iVAM1-1 the default filename would be "**wohler_presets_iVAM1-1-v1.0.0.pdb**" Do not change the file suffix and prefix (marked in red). However, you may change the Preset Tag to any number or text to suit your requirements.

Figure 4-17: Database Export

Export Configuration

Use the following steps to save the Preset configuration in the iVAM1-1 to the computer hard drive:

1. If you need to, revise the Preset Tag name, observing the advice in the advice in the previous section.
2. Click the **Export** button on the **Import / Export Presets** page, as shown in Figure 4-17.
3. A small **Verify** window will appear:

4. Click **Yes** to proceed with writing the Preset data to the hard drive. The copying will proceed. After the Preset data has been written, the screen in Figure 4-18 will appear, explaining what has been exported in an Export Presets Summary. It will also note whether there were any errors in the process. If there were any errors, repeat these steps to try again.

Figure 4-18: Database Export

Import Configuration

Use the following steps to copy the Preset configuration into the iVAM1-1:

1. Click the **Browse** button as shown in Figure 4-18 and select the Preset Tag you would like to import.
2. If you want to allow existing Presets to be overwritten with imported Presets of the same name, check the **Overwrite an existing Preset** box. It is a good idea to do this.
3. Click the **Import** button. The copying will proceed. When complete, the screen in Figure 4-19 will appear, explaining what has been imported in an Import Presets Summary. It will also note whether there were any errors in the process. If there were any errors, repeat these steps to try again.

Figure 4–19: Database Import

Import / Export Presets

Exports Presets

Download all Presets from your iVAM1-1 unit onto your computer.

2 ☒ Preset Tag must not exceed 32 characters.

Import Presets

Upload Presets from a file to your iVAM1-1 unit.

No file chosen ☐ Overwrite an existing preset with information from import file.

Import Presets Summary

		Total	Current	Max
Groups		0	1	16
Presets		0	1	512
Max Presets Per Group				32
Skipped Presets		1

System

Click on **System** to find three tabs, each containing important information about the iVAM1-1. These tabs are explained in the following three sections.

System Information

This tab displays a variety of information about the iVAM1-1. It is shown in Figure 4-20. This information could be useful to view if you are contacting Wohler Technical Service.

Figure 4-20: System Information Tab

SFP Information

This tab displays a variety of information about the module inserted into the SFP slot on the rear panel of the iVAM1-1. It is shown in Figure 4-21. This information could be useful to view if you need to ascertain what module, if any, is installed, or if you are contacting Wohler Technical Service.

Figure 4-21: SFP Information Tab

The figure consists of two screenshots of the iVAM1-1 System Setup interface. The top screenshot shows the 'SFP Information' tab selected, displaying hardware information for SFP Slot 1. The bottom screenshot shows the same interface but with the 'Network Configuration' tab selected for SFP Slot 1, displaying network settings.

System Setup - SFP Information Tab (Top Screenshot)

Hardware Information	
Description	3G/HQ/SD/ASI coax video, single Rx, long reach, non-MSA, HD-BNC, active loopback
Short Description	SDI
Approved	True
Vendor Name	EMBRIONIX
Vendor Part Number	EB30HD1R-LN-AL
Vendor Revision	301A
Wohler Part Number	629136

System Setup - Network Configuration Tab (Bottom Screenshot)

Network Configuration	
Address	10.160.199.110
DHCP	False
DHCP Success	False
Gateway	10.160.1.2
MAC	40A2:00A0:C7:DE
Mask	255.0.0.0
Name	emslr-A0-C7-DE

Note: SFP Information, as shown in lower half of Figure 4-21, can be used to retrieve the 2110 or 2022 SFP Module network configurations. This is useful if the customer forgets the IP address assigned to these SFP modules.

Licenses

This tab displays the license number for each of the modules or features in the iVAM1-1. It is shown in Figure 4-22. You will use this tab to enter any new license numbers that you purchase. Contact Wohler Sales to obtain new license numbers. If you need help, Wohler Technical Service will be happy to assist you in installing these numbers.

Figure 4-22: Licenses Tab

The example above shows an iVAM1-1 with license keys for inputs and license keys for SFP modules installed.

To enter the license key provided to you by Wohler Customer Service, use the following steps:

1. Click the field to the right of the input or module desired.
2. Enter the license key in the box.
3. Repeat Steps 1 and 2 for any other license keys that you want to enter.
4. Click the **Refresh** button to save the information. Each new license will be immediately available for use.

Factory Reset

The **Factory Reset** function should be used with caution. It deletes all of the settings you have programmed into the system. It returns the system to the way it was when received new from the factory. After using this function, you will need to reprogram everything from the start.

Figure 4–23: Factory Reset

If you have any doubt as to whether you should perform a Factory Reset, do not click the **Initiate Factory Reset** button. Contact Wohler Technical Service for advice.

Note: **Factory Reset** will also reset your IP address to the default one. After a Factory Reset, the IP Settings will need to be updated. The default IP address for the unit is determined based upon the Mac address. It is 169.254.1.xx where xx is the last octet of the management Mac address. For example, if the Mac address is b4:ed:54:d0:04:28 then the IP address would be 169.254.1.40 (40 is the decimal equivalent for the last octet of Mac address 28.)

Reboot System

The **Reboot System** page allows you to reboot an iVAM1-1 remotely. The **Reboot System** page is shown in Figure 4-24. This function is normally only used upon request from Wohler Technical Service to troubleshoot or correct an issue.

The **Reboot System** function should be used with a bit of caution. It puts the iVAM1-1 out of service for several minutes while it is rebooting, and this may unexpectedly interfere with the use of the product by the remote operator.

Figure 4-24: Reboot System

If you have any doubt as to whether you should reboot the remote iVAM1-1, do not click the **Reboot System** button. Contact Wohler Technical Service for advice.

APPENDIX A: Software Upgrades

Introduction

This chapter describes how to download a software update file to your computer, transfer it to a USB flash drive and install the update into an iVAM1-1.

Download the Software

The iVAM1-1 software update can be found at <http://www.wohler.com>, under Product Downloads on the Products > iVAM1-1 page, in Support > Downloads > Drivers & Software, or contact Wohler Customer Support for more information.

Unzip the downloaded update files to reveal two files. One will have a suffix of **.wx** and the other will have a suffix of **.md5sum**. Both files are needed for the upgrade.

Update Methods

There are several software update methods. Select one of them, depending upon your needs:

1. Local update from the front panel of the iVAM1-1: This straightforward method does not require the use of the Web GUI. A flash drive containing the update is plugged into the front panel USB socket and the update is then accomplished using the self-contained menu system. If this method seems most suitable, then refer to the [Local Update from the Front Panel](#) section of this chapter.
2. Remote update using the Web GUI with a flash drive connected to the iVAM1-1: It may be more convenient to update the product using a flash drive plugged into its front panel USB socket, but controlled remotely via the Web GUI. To update the product this way, refer to the [Updating via the Web GUI](#) section of this chapter.
3. Remote update without a flash drive: This method allows you to update a networked iVAM1-1 remotely without plugging a flash drive into its front panel USB socket. To update the product this way, refer to the [Updating an iVAM1-1 Remotely](#) section of this chapter.
4. Update multiple units remotely at once: This method allows you to update multiple networked iVAM1-1 units at once, without plugging flash drives into their front panel USB sockets. To update products this way, refer to the [Updating Multiple iVAM1-1 Units Remotely](#) section of this chapter.

Local Update from the Front Panel

Use the following steps to update the iVAM1-1 software:

1. Copy the unzipped Wohler Update Package file(s) from your computer to the root directory (not inside of a folder) of a USB flash drive. It must be FAT32 file type, and does not need to be empty. Refer to the [Download the Software](#) section of this chapter for the specifics of download and file transfer to the USB flash drive.
2. Insert the USB flash drive with iVAM1-1 update package(s) into the front panel USB jack.
3. From the **Menu** screen, touch **System Options**. The screen shown in Figure A-1 will appear.

Figure A-1 - System Options Screen

4. In the **System Options** menu, touch **System Update**. The **Software Upgrade** screen will appear, as shown in Figure A-2.

Figure A-2 - Software Upgrade Screen

5. The new software version that is in the flash drive will be shown in the

Software Version screen. To cancel the upgrade at this point for any reason, touch **Back**. To proceed, touch the software version entry in the **Software Version** screen. A screen will appear, as shown in Figure A-3.

Figure A-3 - Upgrade Verify

6. To proceed, touch **Yes**. To back out, touch **No**. After you touch **Yes**, the screens will change, as shown in Figure A-4. The left screen will display "Software Upgrade in Progress" until the upgrade is complete.

Figure A-4 - Upgrading System

After the software update starts, the text on the left screen will change periodically to indicate the progression of the upgrade. The upgrade will take 5 minutes or more, after which the iVAM1-1 will restart. After the system has completed its restart cycle and is once again operational, you may then remove the flash drive.

Important:

Do not interrupt or remove power to the iVAM1-1, or remove the USB drive during the installation process. Doing so could crash the iVAM1-1 software.

Updating via the Web GUI using a Flash Drive

Use the following steps to update the iVAM1-1 software:

1. Copy the unzipped Wohler Update Package file(s) from your computer to the root directory (not inside of a folder) of a USB flash drive. It must be FAT32 file type, and does not need to be empty. Refer to the [Download the Software](#) section of this chapter for the specifics of download and file transfer to the USB flash drive.
2. Connect to the iVAM1-1 with the Wohler Web GUI. Navigate to the **System | System Update** menu, as shown in Figure A-5. If the iVAM1-1 has recently been powered and it contains the Dolby Decoder option, then a message may appear asking you to wait for a number of seconds so that the decoder will be operational.

Figure A-5 – System Update Menu

3. Click on the **Refresh** button.
4. Available software update(s) are shown as in Figure A-6. Click the one you want, followed by clicking the **System Update** button.

Figure A-6 – Available Software Updates

5. After clicking the System Update button, a verification screen displays as shown in Figure A-7. If you agree that the correct update version has been selected, click the **Yes** button.

Figure A-7 – System Update Verification

6. Next, the update begins, showing the screen in Figure A-8. The circle in the center of the screen, along with status messages below it, will indicate the progress of the update.

Figure A-8 – Software Upgrade in Progress

7. At this point, wait for the update to complete. It may take several minutes, but **it is critical not to disturb the iVAM1-1 or the Web GUI** until the update process is complete. When it is complete, the iVAM1-1 will restart.

Updating an iVAM1-1 Remotely

Use the following steps to update the iVAM1-1 software:

1. The Software Update files you downloaded earlier must be in the same computer that is running the Web GUI. Connect to the iVAM1-1 with the Wohler Web GUI. Navigate to the **System | System Update** menu. Click within the large blue dotted line rectangle at the right of the screen. A file selection window will open, as shown in Figure A-9.

Figure A-9 – System Update Menu

2. Click the two update files. One will have a suffix of **.wx** and the other will have a suffix of **.md5sum**. If you make a mistake and click the wrong file(s), click the **Cancel Upload** button and try again. When the files have uploaded, the **System Update** button will be enabled. Click it. If there is a problem with the files as this point one of the screens shown in Figures A-10 or A-11 will appear. In that case follow the directions on the screen to retry. If there are no problems, the update will proceed and the screen shown in Figure A-8 will appear.

Figure A-10 – Invalid System File Version

Figure A-11 – Invalid Checksum

3. At this point, wait for the update to complete. It may take several minutes, but **it is critical not to disturb the iVAM1-1 or the Web GUI** until the update process is complete. When it is complete, the iVAM1-1 will restart.

Updating Multiple Units Remotely

Use the following steps to update one or more iVAM1-1 units remotely by transferring the software from a previously updated iVAM1-1:

1. If any of the iVAM1-1 units that you intend to update remotely may be in use, contact the people using them and let them know what you will be doing. The iVAM1-1 units being updated will be temporarily out of service.
2. Use the Wohler Web GUI to connect to an iVAM1-1 already containing the latest update. This will be referred to as the **Master Unit**. Navigate to the **System | System Update | Remote System Update** menu. The screen shown in Figure A-12 will appear and the Web GUI will scan the network for any active iVAM1-1 units.

Figure A-12 – Scanning for iVAM1-1 Units

Note: The scanning process will take 2 minutes. Progress is shown on the screen. If for some reason you would like to stop the scan prematurely, click the **Stop Scan** button.

Important: Do not run the scanning or updating process from **more than one Master Unit** at a time, to avoid problems. Although you may be updating multiple units at the same time, never attempt this process from more than one **Master Unit**.

- When the scanning is complete, a list of found iVAM1-1 units will be shown as in Figure A-13. Click either **Select All** or click only the **Target** units that you want to update.

Figure A-13 – List of Found iVAM1-1 Units

- Then click **Update Selected Devices**. The window shown in Figure A-14 will appear.

Figure A-14 – Apply System Package

- Click **Apply System Update**. The screen shown in Figure A-15 will appear. This screen contains a table showing the update progress of each of the iVAM1-1 units being updated.

Figure A-15 – System Update Progress

6. At this point, wait for each update to complete. It may take several minutes, but **it is critical not to disturb any of the iVAM1-1 units or the Web GUI** until the update process is complete. When it is complete, each iVAM1-1 will restart.

APPENDIX B: Dante Network Setup

Introduction

Installing the iVAM1-1 into an existing and functioning Dante network is virtually plug and play. The iAM rear panel AoIP jack supports 1Gb/s and 100Mb/s Ethernet devices in Dante Audio over IP network configurations.

The AoIP option on the iVAM1-1 supports Hitless and has 2 RJ-45 interfaces, a primary interface and a secondary interface.

Additionally, an SFP slot is provided to receive the AoIP signal using network fiber SFPs. These are 1G SFP slots. The SFP slot always acts as a primary interface.

On iVAM1-1, the AoIP source can be selected through the Source Select option.

The iVAM1-1 is set up at the Wohler factory to be used as a slave rather than a master within the Dante network. Other devices or software, such as a **Dante Controller**, are expected to be responsible for most device configurations and all audio routing.

Please refer to the **Dante Controller User Guide** or other control device documentation for specific network and device setup information. The next section provides a guide to configuring the card and AOiP port.

What is in the iVAM1-1 for Dante

The Dante AOIP option consists of an Audinate Brooklyn II card directly connected to the AOIP port. This port is dedicated to the card and should not be confused with the Wohler unit Management port. These two ports must be on two different subnets, one for the AOIP network and the other for access to the Wohler Web GUI for management of the Wohler unit itself. Either one can be configured to have static or DHCP addresses. The Wohler Web GUI indicates the presence of the Dante card and the AOIP license but does not provide access to the various configuration parameters internal to the card. The speed of the AOIP port is 1G default or 100Mbps.

The Audinate® Brooklyn II card has a simple process to set its initial IP address.

The initial factory setting for the card's AOIP port is DHCP. When connected to a DHCP based Dante network and the unit powered on, the Dante card sets the DHCP server provided address as its default address.

Therefore, if the Dante network has a DHCP server, the unit can be inserted into the network and can be configured further using the Audinate application, Dante Controller, running on a host on the same DHCP based subnet.

If the Dante network is static based or if DHCP fails, the card sets a static Link Local arbitrary address in the format 169.254.x.y, where x and y are each in the range 0 to 255. The mask is set to 255.255.0.0 to provide a ~65000 entry address space.

The Dante Controller host must also have a Link Local address to communicate with the card over the unit's AOIP port. Connect the AOIP port directly to a host (e.g. laptop) running the Dante Controller, where the host address is preconfigured to an arbitrary Link Local address (169.254.x.y, mask 255.255.0.0). The connection can be direct cable or through a switch. The Dante Controller **Device Info** tab shows the card's default static address, speed, etc. By double clicking its entry line, additional settable parameters on the card can be reconfigured to be compatible with the Dante network addressing and other parameters as necessary. When the unit is rebooted on the Dante network, the card will be seen by the Dante Controller used to manage the overall network.

If the Dante Controller **Device Info** tab detects the card but does not allow modification and full presentation of card internals, the **Card ID** will be shown in red, e.g. Wohler-xxxxxx where xxxxxx is the last 6 hex digits of the card MAC address as shown in B-1. This usually indicates that the IP address of the card is not in the same subnet as the Dante Controller host. By double clicking the ID, a **Device View** screen will appear as also shown in Figure B-1 with further details about the two incompatible addresses. Change the address of the host or move the unit to another host with an address compatible with the Dante card.

Figure B-1 – Dante Controller Device Info Tab

Up to 16 of the 64 AoIP receive channels can be monitored at once in the iVAM1-1. The iVAM1-1 transmits up to 20 channels. 1 to 16 are the monitored channel in prefade mode. The remaining four are reserved for future use. Currently they are

mapped to channels being monitored on meter 1 to 4 in post-fade mode. The sixteen iVAM1-1 monitored channels are transmitted to the Dante network.

The iVAM1-1 Dante™ AoIP is configured by the iVAM1-1 to receive up to 64 channels and transmit 16 channels of Dante AoIP at 48 kHz or 44.1 kHz audio sample rates. 48 kHz is the iAM default rate.

Sample rate selection is left up to the Dante™ Controller device or software. *All devices connected to each other through a Dante network must be set to the same sample rate.* Slight ticking may be heard in the iVAM1-1 monitor when monitoring different input types at different sample rates or if sources are asynchronous.

Dante™ Device Setup

The iVAM1-1’s default **Dante Device Name** is “Wohler- ...” followed by the last 6 digits of the Dante port MAC address, as shown in Figure B-2. This name can be changed by the Dante Controller to appear that way on the network, but that will not change the iVAM1-1’s unit name appearing on GUI pages and iVAM1-1 **Remote Metering** or **Discovery** pages.

Figure B-2: iVAM1-1 Name

Dante
Device Name

Device Name	Model Name	Product Version	Dante Version	Device Lock	Primary Address	Primary Link Speed	Secondary Address	Secondary Link Speed
iVAM1-172b0	iAM12-Series	1.0.1	4.2.0.28	☐	172.27.2.15	100pps	N/A	N/A
iVAM1-172b0	iAM-Series	1.0.1	4.2.0.28	☐	172.27.2.20	100pps	N/A	N/A
Wohler-Qef1c4	iAM-Series	1.0.1	4.2.0.28	☐	172.27.2.10	100pps		Link down

During initial setup, you may want to manually change the iVAM unit **Name** in the [System Setup](#) page to match the reassigned **Dante Device Name** for consistency. Refer to Figure B-3.

Figure B-3: Rename iVAM

*Change the iVAM
AoIP Name*

Other changes such as **Latency** settings can be made by the Dante Controller through the **Device View** menus. Some changes may require remote rebooting of the Brooklyn II card to take effect, temporarily interrupting audio and publishing the new information to the network.

Important:

Only 44.1 kHz and 48 kHz audio sample rates are currently supported by the iVAM1-1. The Brooklyn II card would accept a Dante Controller command to operate at other rates, without giving an indication it will not be implemented.

Dante Clock Selection

While the Brooklyn’s internal clock is highly accurate, the iVAM1-1 does not have provisions for external sync clocks, such as those that are GPS or media reference (video genlock or audio word clock) based. So it is generally not the best candidate to be the PTP Master Clock (commonly called the “grandfather clock”) for the network. It can be set as the preferred master if no better clock source exists. Refer to Figure B-4.

The iAM Brooklyn Dante card will serve as a temporary fallback clock source if preferred masters are interrupted. It functions as an accurate slave clock synchronized to the master clock on the network when not operating as the master.

Figure B-4: Clock Selection

Channel Names

The factory default channel names are set to "01 to 64" for 64 received channels and "Monitor Ch 1" to "Monitor Ch 16" for first 16 transmitted channels. The next 4 transmitted channels are set to "Mix Ch 1" to "Mix Ch 4".

Note: To change channel names please refer Dante controller user manual.

AES67

The iVAM1-1 Brooklyn II can be configured for AES67 operation. AES67 operation with Dante is limited to eight or less receive and transmit channels at 48 kHz sample rates.

24 bit linear (L24) encoding and 1 msec packet time are fixed default transmit parameters.

16 bit (L16) or 24 bit (L24) encoding and 125/250/333/100 µsec packet times can be received.

The **Device View - AES67 Config** menu enables/disables AES67.

Figure B-5: AES67 Enable/Disable

Further, Dante AES67 discovery and operational protocol requires manual assignments for static multicast transmit and receive IP addresses per Dante protocols for discovery and IGMP network operation. Destination addresses in range 239.nnn.0.0 – 239.nnn.255.255, port 5004 o nnn can be configured using the Dante Controller. The default is 69. The destination and receive address range must match. Provisions for this are in **Dante Controller Device View - Network Config**. Refer to Figure B-6.

Figure B-7: Multicast

Device Lock

Audinate recently added a feature whereby a remote controller can send a command to lock Dante network device configurations. The iVAM1-1 does not implement the Device Lock command at this time.

Dante Firmware Upgrades

Wohler iVAM1-1 monitors ship with current Brooklyn II firmware as of the option installation date. The version information is found in the **Dante Controller Device View-Status** page. iAM software/firmware is tested with the latest Dante code release. Therefore it is strongly recommended that iVAM1-1 and Dante software/firmware be updated at the same time to ensure compatibility and support of the latest features.

Use the Audinate **Dante Firmware Update Manager** Windows or OS X application to update the Dante firmware over the Dante network. Follow the application's installation and usage guide plus any applicable technical notes available.

Additional Information

The following links are provided for those who need more information about the Dante controller or the Dante Firmware update manager.

APPENDIX D: Ravenna (ZMAN) Setup

Introduction

Installing the iAM or iVAM product into an existing and functioning Ravenna network using the Merging ZMAN Card is virtually plug and play. The iAM or iVAM rear panel AoIP jack supports 1Gb/s and 100Mb/s Ethernet devices in Ravenna Audio over IP network configurations.

iAM or iVAM channel source selections are made by choosing **Input Type 'AoIP'** in the [Configuration-Configure Presets](#) page regardless of which AoIP option is installed.

Note: In addition to the iAM or iVAM configuration, the Merging ZMAN Card needs to be configured using its own configuration tool. The menus in this configuration tool are shown in this Appendix.

What is in the iAM or iVAM for Ravenna?

The AES67 (SMPTE ST-2110-30) enabled Merging ZMAN Card supports the following features:

RAVENNA-Compatible Talker/Listener

- 1) RFC 3551 – RTP Profile for Audio and Video Conferences
 - a) L16 16-bit linear format defined in RFC 3551 clause 4.5.11
 - b) L24 24-bit linear format defined in RFC 3190 clause 4
 - c) AM824 24-bit Audio as defined in IEC61883-6
 - d) Multicast and unicast session support
 - e) 48 kHz and 96 kHz audio sampling rates
 - f) 1 to 8 audio channels per stream
 - g) Up to 64 streams
- 2) Media clock support
 - a) 48 kHz and 96 kHz
- 3) Hitless Stream Redundancy
- 4) IGMP v3 support
- 5) Session Announcement Protocol (SAP) support

AVB Ethernet Features

AVB uses the concept of streams and channels. A stream is a connection from one talker to one or more listeners. One stream can be made up of 1-60 audio channels. The Ravenna option supports the following AVB features:

- 1) AVB 1722 AVTP with multiple subtypes:
 - a) IEC 61883-6 MBLA
 - b) AM824, 24-bit Audio Encapsulation
 - c) Support up to 64 streams

- d) Up to 8 channels per stream
- e) 512+512 Channels of audio
- f) 48kHz and 96kHz sampling rates
- 2) IEEE 802.1Q/SRP
- 3) IEEE 1722.1/AVDECC control
- 4) IEEE 802.1AS/gPTP
- 5) Compatible with Apple OS X devices, such as MacBooks and MacMini computers
- 6) Media clock per the AVnu specification
- 7) Hitless stream redundancy

Configuring the AOIP Merging Option Card

This appendix provides basic information about configuring the Merging ZMAN card by invoking the card's internal configuration application. The Merging card can be configured through a connection to the Ethernet AOIP Port using a browser on the Ravenna network and by using the Merging Aneman Windows application. Aneman is available for free download at:

<https://www.merging.com/support/downloads#aneman>

The iAM or iVAM can be configured using its Front Panel controls or its web interface through its Management port. Details specific to the iAM or iVAM can be found in Chapters 2 and 4 of this manual.

For a Quick Start, set the Source Select menu item on the Front Panel to AOIP to configure iAM or iVAM to receive/source a Ravenna Stream over its AOIP port. The Source Select Menu control also allows selection of a range of channels in groups of 8 channels 1-8 ... 57-64. More details including definition of Presets and individual channel parameters are available by reference to other chapters of this manual.

The Merging Ravenna card runs specific firmware from Merging and augmented by Wohler for use within the iAM or iVAM. The card will not function correctly if the user downloads and installs firmware from any source besides Wohler. The Wohler augmentation includes the ability to support 64 channels.

The Merging card is pre-configured to DHCP mode to obtain its IP address automatically from the Ravenna network. The Ravenna network should be a separate address space from the iAM or iVAM Management port. For example, the iAM or iVAM might be connected to a 10.11.11 subnet and the Ravenna network devices connected together on a 10.15.15 subnet. Aneman and a suitable browser must be resident on a host workstation on the same Ravenna subnet to access the Merging card. For this Appendix, the Ravenna network address will be referred to as <Ravenna subnet>. The Merging card address will then be <Ravenna subnet>.x where x is the specific address of the card on the subnet.

Power the iAM or iVAM and verify the Ethernet connector LEDs are lit and/or blinking. It may take a few minutes for the card to be fully recognized on the Ravenna network after powering the iAM or iVAM.

For Aneman access, the card parameters including its IP address should appear in a panel at the bottom of the screen. In Aneman, make sure Devices under Menu item View is enabled. Do not proceed until the card shows on Aneman. Right click

on that line and select Web Services: Advanced (or Ravenna) to bring up the Merging Ravenna configuration page. Also, the ICON of the card will appear in the main part of the Aneman screen. Double Clicking on the ICON also will load the Configuration screen.

For browser access, the URL is <Ravenna subnet>.x/advanced/index.html. This brings up the Merging Ravenna configuration page. Each tab is explained in the following sections.

Getting Started | General Settings

This tab is shown in the following figure.

Figure D-1: Getting Started | General Settings

The elements of this tab are as follows:

1. **Device Name:** Enter a useful Device Name for the card, which will show up on other Ravenna devices on the subnet.
2. **Sample Rate:** (44100-48000- 88200-96000-176400-192000-352800-384000)
3. **Frame size (@1Fs):** current frame size (64 - AES67/48 - 32 -16 - 12 -6).
4. **Safety Playout Delay (@1Fs):** The value is described at 1Fs (44.1-48 kHz) in samples. For example, if the value is 10, the additional playout delay will be 20 at 2Fs (88.2-96 kHz), 40 at 4FS (176.4-192 kHz)
5. **SSM Source-Specific Multicast:** If needed, configure the network switch for IGMP V3.
6. **Network Interface:** Note the address of the card and its type (Zeroconf, DHCP, Static). (If necessary, the address can be changed to another type such as a Static address which must include a Network Mask and Gateway.)

Getting Started | Out-Of-Band NMOS for ST-2110-30 & Ravenna

The Out-Of-Band Control for the Ravenna module is available using the SFP port. Out-Of-Band NMOS is more relevant in 2110 networks, and often Ravenna cards are used to monitor 2110-30 (the Audio essence of 2110). Customers can use any off-the-shelf network SFP's to connect into the ports shown in the following figure.

Figure D-2: AOIP Ports

The SFP interface on the Ravenna module can be discovered using ANEMAN as with the Primary and Secondary port.

To use the SFP Interface, make sure the Multi-Interface mode checkbox is enabled. Refer to Figure D-3. The IP address configuration for SFP can be made using the "Interface 3" section as shown in Figure D-3. Note that the IP address settings shown in this Figure are for reference only; you should configure each interface per your network.

On the Ravenna web interface, the following nomenclature is used. "Interface 1" for PRIMARY RJ-45 Port, "Interface 2" for SECONDARY RJ-45 Port, "Interface 3" for SFP port. Refer to Figure D-2. Once the network settings for SFP port are configured, the web interface for Ravenna module can be accessed from any of the three interfaces. The default port numbers used to access the web interface are as follows:

- **"Interface 1" (PRIMARY):** Uses port 80. The web page for Ravenna can be accessed using `http://<zman IP>`
- **"Interface 2" (SECONDARY):** Uses port 81. The web page for Ravenna can be accessed using `http://<zman IP>:81`
- **"Interface 3" (SFP):** Uses port 82. The web page for Ravenna can be accessed using `http://<zman IP>:82`

Figure D-3: SFP Interface Setup

Multi-Interface Mode Checkbox

Netmask 255.255.0.0
Gateway 10.11.1.1 ☒ Use as Primary Gateway
DNS 10.10.10.20

Apply

The Ravenna "Interface 1" and "Interface 2" act as Media as well as control ports. In-band NMOS will still continue to work for customers who have control interface on the same network as the media. SFP or "Interface 3" is a Control Only port and should not be connected to Media Network.

The NMOS settings on the Ravenna module can be enabled using the NMOS tab of the Ravenna Web Interface. The registration server can be configured using a Static address, an mDNS, or a search domain. The settings shown in the following Figure are for reference only.

Figure D-4: NMOS Settings

Getting Started | PTP

This tab is shown in the following figure. This configuration page refers to how your Ravenna network is synchronized to clocks.

Figure D-5: Getting Started | PTP

The elements of this tab are as follows:

1. **Global Settings:** The default value for PTP
 - a. **Domain:** For the Merging Ravenna card this value is 0.
 - b. **DSCP:** 46 for PTP AES67 or 48 for PTP Ravenna.
2. **Master:** To modify the PTP setting, you must first check the "Manual" checkbox.
 - a. **Priority:** 1 is the main priority value.
 - b. **Class:** This is the Device class. This value should not be modified.
 - c. **Accuracy:** This field cannot be modified.
 - d. **Priority 2:** This is only used if the other parameters do not allow electing a PTP master.
 - e. **GMID:** This is the current GrandMasterID (PTP Master)
 - f. **Slave only:** This forces the Merging device to always be PTP slave.
 - g. **Delay Mech.:** This is PTP Profile related - E2E or P2P
 - h. **Announce:** This is PTP Profile related - PTP announcement interval (1 - 2 - 4 - 8 -16 seconds)
 - i. **Sync:** This is PTP Profile related (0.0625 - 0.125 - 0.25 - 0.5 seconds)

3. Status:

- a. **Lock:** This shows if the device is locked to PTP (Locked -Locking - Unlocked)
 - b. **Master:** This is true or false for the current device.
 - c. **GMID:** This is the current GrandMasterID (PTP Master)
 - d. **Delta (ns):** This is the time delta between the device and the PTP master.
4. **Graph:** The graph is only active for slave devices and shows the device delta against Master PTP clock.
5. **PTP Priority Value:**
- a. 1 is the highest priority, 255 the lowest one.
 - b. Merging card is by default using Priority 127 when set as PTP Master and 255 when PTP slave.

Getting Started | Session Sources

This tab defines which Streams are to be Sourced from this card. It is shown in the following figure.

Figure D-6: Getting Started | Session Sources

The elements of this tab are as follows:

1. **Create session button:** Create a new session sources by clicking on left ICON.
2. **IO:** Select the physical input (when applicable).
3. **Name:** This is the Source name.
4. **Advertise:** Check to enable source advertising on the network.
5. **Auto-unicast - (RTSP):** Check to automatically retrieve the sink (listener) IP address:port for unicast connection.
6. **Address:** This the stream's multicast address. Note that the user defined checkbox is activated automatically when entering a multicast address manually.
7. **TTL:** Time to Live (also called Hop Limit) - This value should not be modified.
8. **Payload type:** RTP Payload type - This value should not be modified.

9. **Codec:** The possible bit rate values are L24, L16, DSD64, DSD64_32, DSD128, DSD128_32, and DSD256. Note that these values are sampling rate dependent.
10. **Frame size (samples):** This the frame size of the current source.
11. **DSCP:** The audio DSCP should be set to 34 for RTP AES67 or 46 for RTP Ravenna.
12. **RefClk PTP traceable:** This feature is useful when you want to connect a stream through Internet (for example with two PTP Masters (GPS) at each location). This allows making connections with devices locked to different traceable PTP Masters. Refer also to Ignore RefClk GMID - accept source locked to any PTP master, on the Session Sinks tab.
13. **Channels:** This is the number of channels in the stream. The drop-down menu allows selection of specific channel range if the number of channels is less than 8.
14. **The URL of the SDP of this session:** This allows saving of the Session Description into a file, which is useful for specific third party devices if a manual SDP has to be provided.

Getting Started | Session Sinks

This tab defines streams which are sinked in this card. It is shown in the following figure.

PTPv2 0

98 L24/48000/8

The elements of this tab are as follows:

1. **Create session button:** Create new session sinks by clicking on left ICON.
2. **IO:** Select the physical output (when applicable).
3. **Label:** This is the Sink name.
4. **Source:** This is a drop down menu to select a source (both sap and bonjour advertised sources are automatically listed).
5. **Manual:** This allows manual entry of an SDP.

6. **Delay (samples):** This sets the playback delay. 0 is automatic delay.
7. **Ignore RefClk GMID - accept source locked to any PTP master:** This feature is useful when you want to connect a stream through Internet (for example with two PTP Masters (GPS) at each location. This allows making of connections with devices locked to different traceable PTP Masters. See RefClk PTP traceable on the Session Sources tab.
8. **Channels:** Channel count: The drop-down menu allows selection of specific channel range if the number of channels is smaller than 8.

Getting Started | Session Info

1. **RTP Status:** The following bit positions indicate the connection status:

0x10: receiving RTP packets (OK)

0x01: wrong RTP sequence id

0x02: wrong RTP SSRC

0x04: wrong RTP payload type

0x08: wrong RTP SAC

0x20 stream has been muted

0x40: Horus implementation - an incoming stream is muted

Important Note: The above error numbers are summed. For example, Stream Muted and Wrong Payload together are indicated by 0x24.

2. **Playout Delay:** This is the current playout delay on the selected sink in samples and ms.
3. **RTSP Host:** This is the connected source IP Session name: defined in SDP (usually the same as the source name)
4. **Clock Domain:** This is the PTP clock type and domain
5. **Payload:** Selections are Payload / Codec / Sampling Rate / Number of Channels
6. **SDP:** This displays detailed SDP information on the current stream.

Getting Started | Ins/Outs

This tab allows you to change the name of the specific Inputs and/or Outputs.

Figure D-8: Getting Started | Ins/Outs

Getting Started | I/O Router

This page allows remapping of incoming channels to different internal channel assignments. For example, Stream channel 1 can be remapped to Merging card Channel 0, and so on.

Figure D-9: Getting Started | I/O Router

Operation:

Connecting Remote Source to Local Sink

This instruction assumes another Ravenna device is active on the network and sourcing a multicast stream. The Merging Configuration section for Session Sink controls how to configure the card to receive the stream and provide it to the iAM interface for display on meters and speakers, etc. The iAM or iVAM must be set to receive AOIP from the Source Select Front Panel menu or from a browser iAM or iVAM GUI.

Ravenna Streams can contain up to 8 channels of information. The collections of channels in a specific Stream are termed Flows. For example, to source an SDI 16 channel signal might be accomplished by two Flows, each consisting of 8 channels. A stereo AES Flow consists of one Flow of two channels.

ZMAN Session Sinks

This assumes that 1 or more sources are present on the AOIP Ravenna network. Right Select Advanced on the entry for the Merging ZMAN device in Aneman. This brings up the browser page with tab set to General configuration GUI for the ZMAN card. This is shown in Figure D-1.

Use the following procedure:

1. Select the **Session Sinks** tab and use the **Create Session Sinks** icon (in the upper left corner) to see the available source Flows.
2. Create an entry on the left panel for each source Flow to be configured.
3. Select the desired Flow and set the number of channels in the Flow. Select the desired range to direct the Flow to the internal channels of the iAM or iVAM.
4. Click the matrix, as shown in Figure D-10, to direct the incoming channels to the desired iAM or iVAM channels.

For example, a 16 channel SDI source consists of two 8 channel Flows. One could be mapped to channels 1-8 and the other could be mapped to 9-16.

Notice that the Tab I/O Router duplicates the Session Sinks matrix and can be used to map channels from input source assignments to iAM or iVAM channels also.

Input channels can be mapped to more than one iAM or iVAM channel by selecting additional matrix elements to map input channels 1-8 to both 1-3 and 5-8.

Figure D-10: Session Sinks Tab

To avoid confusion if monitoring more than one Flow, especially if the various source Flows have overlapping channel numbers, use the matrix to direct Flows to higher channel ranges. For example, for monitoring 2 SDI sources (four 8 channel Flows), assign two flows to 1-8 and 9-16 and the next SDI signal to 17-24 and 25-32. Touch the iAM or iVAM AOIP selection menu to select the proper range to monitor, up to 57-64.

Select **Apply** to enable the Sink process, which results in the meters and audio becoming available on the iAM or iVAM.

ZMAN Session Sources

If the ZMAN card is to Source Flows, use the **Session Sources** tab. Refer to Figure D-11. The procedure is similar to defining Sinks with the additional step to provide the Flow a name to appear on other units in the network. Select the channel range with a maximum of 8 channels per Flow.

Figure D-11: Session Sources Tab

The screenshot shows the 'Session Sources' configuration page for a Wohler AES67 device. The interface includes a top navigation bar with tabs for General settings, PTP, Session sources, Session sinks, Ins/Outs, I/O Router, Statistics, NMOS, and System. The 'Session sources' tab is active, showing a list of sources on the left and a configuration panel on the right.

Configuration Panel:

- Enabled:** ☒
- IO:** Stream
- Name:** wohler_110444_2
- Output Interface(s):** Interface 1
- Auto-unicast:** ☐ retrieve unicast address+port from sink (RTSP)
- Address:** 239.1.15.8
- Address sec:** (empty)
- TTL:** 15

ZMAN Updating

The ZMAN card is pre-initialized with the correct Wohler firmware load. In case of future upgrades, use the following steps:

1. The ZMAN module update manager is accessible using the ZMAN web interface. The default page displayed is as below.

Figure D-12: Default Screen

2. When this web page has loaded, select **Info** to navigate to the firmware update screen which appears as follows.

Figure D-13: Firmware Update Screen

3. Click the Firmware Update **Open** button.
4. When **Open** is selected, a new webpage allows you to select the firmware file. ZMAN firmware consists of custom firmware packages created by Wohler. Make sure that only firmware packages provided by Wohler are used

for updating the Wohler supplied ZMAN modules. Press the **Select File** as shown in the following figure.

Figure D-14: Firmware Selection Screen

5. Once **Select File** is pressed, the screen shown in the following figure is displayed. This brings up a web page which prompts for the location of the Wohler provided upgrade file. The file should resemble the following:

firmware_1.9.0_iVAM_wohler.oem

Select **Update** to begin the update process.

Figure D-15: Update File Selection Screen

6. The update takes 15-20 minutes to complete.

Please make sure the unit is not rebooted or shut down while the ZMAN update is in process.

While the update is taking place, the screen in the following figure is

displayed. It will provide a running estimate of the percentage of the update that has been completed so far.

Figure D-16: Updating in Process Screen

7. When the update has been completed, the following screen is displayed. Click the **Reboot Device** button to reboot the ZMAN module after the successful update.

Figure D-17: Update Successful Screen

8. Close the web pages and return to Aneman to set up Sources and Sinks.

APPENDIX E: API Documentation

Introduction

This appendix discusses ways to use the Application Program Interface (API) to allow third party equipment to remotely access options and settings of the iVAM1-1. It includes specific code examples for commonly used requests. The API uses JavaScript Object Notation (JSON) as its communication language.

Follow the instructions in the **First Time IP Assignments** section of Chapter 4 to achieve the required network connection.

API

APPENDIX G: 2110 SFP Personalities

Introduction

Wohler currently offers two variants of the 2110 SFPs:

1. 2110 with NMOS or Ember+
2. 2110+2022-6 with NMOS or Ember+

The primary distinction between these options lies in the firmware, or "Personality," loaded onto the SFP. Both the firmware and the SFPs are supplied by Embrionix. For the Combo-SFP, the Embrionix SFP is loaded with both NMOS and Ember+ firmware, with NMOS firmware set as the default.

If it becomes necessary to switch to the Ember+ personality, this can be done changing the SFP Firmware Configuration. This Appendix describes the method to make this change.

Personality Change

Locate the Combo SFP IP Address on the SFP Information Tab of the System page. Refer to Figure G-1, which shows the System page of a typical Wohler iAM or iVAM product.

Figure G-1: Combo SFP Address Location

The following example will illustrate the steps to take in order to change from **2110 NMOS** to **2022-6**.

First open a new web page in a pc using Google Chrome, and type in the Combo SFP IP Address you located in Figure G-1. That address was 10.161.93.236. The Embrionix Support screen will appear as in Figure G-2 showing the configuration of the Combo SFP:

Figure G-2: Embrionix Support Screen

The screenshot shows the Embrionix Support web interface. It includes contact information, loaded firmware details, and a firmware configuration table. The table has columns for Element, Product, Description, Version, Tag, Size, CRC, Default, and Action. Element 2 is highlighted in green, indicating it is the currently selected default personality.

Element	Product	Description	Version	Tag	Size	CRC	Default	Action
0	4	DEC_2110_1ch_-31-E+_SFP	3.9	4417	4173824	2937EAB9	No	Load Now Clear
1	9	DEC_2022-6_1ch_NoOut_SFP_470	4.7	2360	4173824	27C43BD5	No	Load Now Clear
2	4	DEC_2110_1ch_-31-ISO4_SFP	3.12	4497	4173824	4730CCF5	Yes	Load Now Set As Default
3								Upload Choose File No file chosen

There are four Personality locations in the SFP, as listed in the Elements column:

- Element 0: 2110 **EMBER+** (Note that the Description contains **E+**.)
- Element 1: **2022-6** (Note that the Description contains **2022-6**.)
- Element 2: **2110 NMOS** (Note that the Description contains **ISO4**.)
- Element 4: (empty)

Note that Element 2 is back lighted in green to show that it is the currently selected Default Personality. This is the Personality that is automatically selected when the product powers on.

To change from the **2110 NMOS** Personality to the **2022-6** Personality, perform the following two steps which follow this important caution:

Caution: In performing these steps, **Do Not click on the Clear button**. Doing this would permanently delete the Personality from the SFP module.

1. Click the **Load Now** button in the **Action** column of the **Element 1** row. Wait 5 seconds until the **Set As Default** button appears in the Action column of the **Element 1** row.
2. Click on the **Set As Default** button which has now appeared in the **Element 1** row. **2022-6** is now the Default Personality, and the screen should appear as shown in Figure G-3.
